REVISION HISTORY

Document Release	Date	Revision	Initials
1.0	1/14/03	Initial public release, same as internal revision 0.92 with confidential watermark removed	DH
1.01	4/8/03	Updated Table 1 in Overview to indicate correct CRT screen resolutions supported Updated mechanical specs to fix incorrect JEDEC-spec reference	DH
1.1	4/25/03	Changed chipset name to north bridge chip name and removed VT# Changed incorrect figure captions to table captions	DH
1.2	5/29/03	Added "Version CD" to cover page Fixed supported screen and LCD resolutions (1400x1050 max)	DH
2.0	5/29/03	Changed "Version CD" to "Version CD / CE"	DH
2.01	7/1/03	Removed 8MB Frame Buffer support Fixed internal AGP speed & resolutions supported in graphics feature bullets & overview Removed CPU/DRAM 133/100 freq support; added "Version CD/CE" to page header	DH
2.02	7/17/03	Added 8MB Frame Buffer support information in product features, Table 1 (supported CRT screen resolutions) and register setting of Device 0 RxE1[6:4] Fixed typo of VCC25 information in notes of the pin list	AL
2.03	3/22/04	Updated cover page, legal page and header Updated the RSET resistor value in pin description table Capitalized north bridge and south bridge Modified the name of table 2 and table 3 Modified legend in mechanical specification	SV
2.04	4/19/04	Added mechanical specifications for lead-free concern	EY
2.05	8/11/04	Updated mechanical specification figure	SV
2.06	12/1/04	Updated top marking in mechanical specificalton	VL

CLE266 VERSION CD / CE

NORTH BRIDGE

Single-Chip SMA North Bridge
with 133 / 100 / 66 MHz Front Side Bus for VIA C3 CPUs
with Integrated 2D / 3D AGP Graphics Core
plus Advanced DDR Memory Controller
supporting DDR266 / 200 DDR SDRAM
and PC133 / PC100 SDR SDRAM
for Desktop PC Systems

PRODUCT FEATURES

- **Defines Integrated Solutions for Value PC Desktop Designs**
 - High performance SMA North Bridge: Integrated Apollo Pro266T and graphics accelerator in a single chip
 - 64-bit advanced memory controller supporting DDR266 / 200 DDR SDRAM and PC133 / PC100 SDR SDRAM
 - Combines with VIA VT8233A V-Link South Bridge for integrated audio, ATA-133 IDE and 4 USB ports
- **High Performance CPU Interface**
 - Support for Socket-370 VIA C3 processors
 - 133 / 100 / 66 MHz CPU Front Side Bus (FSB)
 - Built-in Phase Lock Loop circuitry for optimal skew control within and between clocking regions
 - Five outstanding transactions (Four In-Order Queue (IOQ) plus one output latch)
 - Dynamic deferred transaction support
- **High Bandwidth 266 MB / Sec 8-Bit V-Link Host Controller**
 - Supports 66 MHz V-Link Host interface with total bandwidth of 266 MB/Sec
 - V-Link operates at 2x or 4x modes
 - Full-duplex commands with separate strobe / command
 - Request / Data split transaction
 - Configurable outstanding transaction queue for Host to V-Link Client accesses
 - Supports Defer / Defer-Reply transactions
 - Transaction assurance for V-Link Host to Client access (eliminates V-Link Host-Client Retry cycles)
 - Intelligent V-Link transaction protocol to minimize data wait-states / throttle transfer latency. All V-Link transactions (both Host and Client) have a consistent view of transaction data depth and buffer size to avoid data overflow.
 - Highly efficient V-Link arbitration with minimum overhead. All V-Link transactions have predictable cycle length with known Command / Data duration.

- **Advanced High-Performance DDR / SDR DRAM Controller**

- Supports DDR266 / 200 DDR SDRAM and PC133 / PC100 SDR SDRAM memory types
- DRAM interface synchronous with host CPU (133 / 100 MHz) for most flexible configuration
- DRAM interface may be faster or slower than CPU by 33 MHz
- Concurrent CPU, AGP and V-Link access
- Mixed 1M / 2M / 4M / 8M / 16M / 32M / 64MxN DRAMs
- Supports 4 banks up to 2 GB DRAMs (512Mb x8 / x16 DRAM technology)
- Flexible row and column addresses. 64-bit data width only
- LVTTL 3.3V DRAM interface with 2.5V SSTL-2 DRAM interface (DDR) and 5V-tolerant inputs (SDR)
- Programmable I/O drive capability for MA, command and MD signals
- Two-bank interleaving for 16Mbit SDRAM support
- Two-bank and four bank interleaving for 64Mbit SDRAM support
- Supports maximum 8-bank interleave (i.e., 8 pages open simultaneously); banks are allocated based on LRU
- Seamless DRAM command scheduling for maximum DRAM bus utilization (e.g., precharge other banks while accessing the current bank)
- Four cache lines (16 quadwords) of CPU to DRAM write buffers
- Four cache lines of CPU to DRAM read prefetch buffers
- Read around write capability for non-stalled CPU read
- Speculative DRAM read before snoop result
- Burst read and write operation
- x-1/2-1/2-1/2-1-1/2-1/2-1/2 back-to-back accesses for DDR SDRAM (x-1-1-1-1-1-1 for SDR)
- Supports DDR SDRAM CL 2/2.5/3 and 1T per command
- Decoupled and burst DRAM refresh with staggered RAS timing (CAS before RAS or self refresh)

- **Integrated Graphics / Video Accelerator**

- Optimized Shared Memory Architecture (SMA)
- 8 / 16 / 32 / 64MB frame buffer using system memory
- Internal AGP 4x-equivalent performance
- Separate 128-bit data paths between North Bridge and graphics core for pixel data flow and texture / command access
- Graphics engine clocks up to 133 MHz decoupled from memory clock
- Direct hardware inputs to force graphics accelerator into suspend / standby states
- High quality DVD video playback
- VIP 1.1 / VIP 2.0-compatible video capture inputs up to 165 MHz data rate
- Internal hardware VGA controller with true-color / high-color sprite for hardware cursor implementation
- 128-bit 2D graphics engine
- 128-bit 3D graphics engine
- Floating point triangle setup engine
- 3M triangles/second setup engine
- 133M pixels/second trilinear fill rate

- **Extensive Display Support**

- CRT display interface with 24-bit true-color RAMDAC up to 250 MHz pixel rate with gamma correction capability
- Direct TFT flat panel interface up to 24-bit data width supporting 18, 24 or 18+18 TFT panels or LVDS encoders
- 12-bit DVI 1.0-compatible interface for drive of flat panel monitor using external TMDS encoders
- Interface to external TV Encoder for NTSC or PAL TV display
- Flexible output configuration: CRT output plus 8-bit video capture port plus either 1) LCD Panel + DVI or TV-Out or 2) DVI + TV-Out + 2nd 8-bit video capture port (or video capture port extension to 16-bit)
- Support for panel resolutions up to 1600x1200, CRT resolutions up to 1400x1050 and DVI up to 1280x1024
- Automatic panel power sequencing and VESA DPMS CRT power-down
- Dual view capability where CRT and Flat Panel Monitor can have a different resolution and refresh rate
- Built-in reference voltage generator and monitor sense circuits
- I²C Serial Bus and DDC Monitor Communications for CRT Plug-and-Play configuration

- **Video Support**

- Up to three video windows for video conferencing applications
- High quality scaler (up or down) for both horizontal and vertical scaling (linear interpolation for horizontal and vertical up-scaling and filtering for horizontal and vertical down-scaling)
- Color space conversion
- Color enhancement (contrast, hue, saturation, brightness and gamma correction)
- Color and chroma key support
- Hardware sub-picture blending
- Bob / weave de-interlacing mode and advanced de-interlacing to improve video quality
- Video capture inputs (one or two 8-bit ports or one 16-bit port) with built-in phase adjuster to fine tune the clock/data signal timing
- PAL / NTSC TV output capability using external TV encoder
- Supports CCIR601 standard

- **MPEG-2/1 Video Decoder**

- Motion compensation for full speed DVD playback
- Hardware accelerated Slice layer, IDCT and Motion compensation

- **2D Hardware Acceleration Features**

- BitBLT (bit block transfer) functions including alpha blts
- Text function
- Bresenham line drawing / style line function
- ROP3, 256 operation
- Color expansion
- Source and destination color keys
- Transparency mode
- Window clipping
- 8, 15/16 and 32 bpp mode acceleration

- **3D Hardware Acceleration Features**

- Microsoft DirectX 7.0 and 8.0 compatible
- OpenGL driver available
- Floating-point setup engine
- Triangle rate up to 3-million triangles per second and Pixel rate up to 133-million pixels per second for 2 texture, depth test and alpha blending
- Flat and Gouraud shading
- Hardware back-face culling
- 16-bit, 32-bit Z test and 24+8 Z+Stencil test support
- Z-Bias support
- Stipple Test, Line-Pattern test, Texture-Transparency test, Alpha test support
- Edge anti-aliasing support
- Two textures per pass
- Tremendous Texture Format: 16/32 bpp ARGB, 1/2/4/8 bpp Luminance, 1/2/4/8 bpp Intensity, 1/2/4/8 bpp Paletized (ARGB), YUV 422/420 format
- Texture sizes up to 2048x2048
- High quality texture filter modes: Nearest, Linear, Bi-linear, Tri-linear, Anisotropic
- LOD-Bias support
- Vertex Fog and Fog Table
- Specular Lighting
- Alpha Blending
- High quality dithering
- ROP2 support
- Internal full 32-bit ARGB format for high rendering quality
- System balance to achieve high performance

- **Advanced System Power Management**

- Power down of SDRAM (CKE)
- Independent clock stop controls for CPU / SDRAM and on-chip AGP bus
- Suspend power plane for preservation of memory data
- Suspend-to-DRAM and self-refresh power down
- Low-leakage I/O pads
- ACPI 1.0B and PCI Bus Power Management 1.1 compliant

- **Full Software Support**

- Drivers for major operating systems and APIs: [Windows® 9x, Windows NT, Windows 2000, Windows XP, Direct3D™, DirectDraw™ and DirectShow™, OpenGL™ ICD for Windows 9x, NT, 2000 and XP]
- North Bridge / Chipset and Video BIOS support (including all standard VESA CRT display modes)

- **2.5V Core and Mixed 3.3V / 5V Tolerant and GTL+ I/O**

- **27 x 27mm Ball Grid Array Package with 548 Balls and 1mm Ball Pitch**

CLE266 SYSTEM OVERVIEW

CLE266 is a high performance, cost-effective and energy efficient SMA chipset North Bridge which may be used for the implementation of desktop personal computer systems with 133 / 100 / 66 MHz CPU host bus ("Front Side Bus") frequencies and based on 64-bit Socket-370 VIA C3 processors.

Figure 1. System Block Diagram

The complete chipset consists of the CLE266 North Bridge and the VT8233A V-Link South Bridge. The CLE266 North Bridge integrates VIA's Apollo Pro266T system controller, 128-bit graphics accelerator and flat panel interfaces into a single 548 BGA package. The CLE266 provides superior performance between the CPU, DRAM, V-Link bus and internal AGP 8x graphics controller bus with pipelined, burst and concurrent operation. The VT8233A V-Link Client controller is a highly integrated PCI / LPC controller. Its internal bus structure is based on a 66 MHz PCI bus that provides 2x bandwidth compared to previous generation PCI / ISA bridge chips. The VT8233A also provides a 266 MB / Sec bandwidth Host / Client V-Link interface with V-Link-PCI and V-Link-LPC controllers. It supports five PCI slots of arbitration and decoding for all integrated functions and LPC bus.

CLE266 Version CD / CE Overview

The CLE266 supports four banks of DDR / SDR SDRAMs up to 2 GB. The DRAM controller supports DDR266 / 200 Double-Data-Rate (DDR) SDRAM but can also support standard PC133 / PC100 Synchronous DRAM (SDR SDRAM). The DDR / SDR DRAM interface allows zero wait state bursting between the DRAM and the data buffers at 133 / 100 MHz. The different banks of DRAM can be composed of an arbitrary mixture of 1M / 2M / 4M / 8M / 16M / 32M / 64M xN DRAMs. The DRAM controller can run either synchronous or pseudo-synchronous with the host CPU bus.

The CLE266 host system controller supports a high speed 8-bit 66 MHz Quad Data Transfer interconnect (V-Link) to the VT8233A South Bridge. Each chip also contains a built-in bus-to-bus bridge to allow simultaneous concurrent operations on each bus. Five levels (doublewords) of post write buffers are included to allow for concurrent CPU and V-Link operation. For V-Link Host operation, forty-eight levels (doublewords) of post write buffers and sixteen levels (doublewords) of prefetch buffers are included for concurrent V-Link bus and DRAM/cache accesses. The combined V-Link Host and Client controllers realize a complete PCI sub-system that supports enhanced PCI bus commands such as Memory-Read-Line, Memory-Read-Multiple and Memory-Write-Invalid commands to minimize snoop overhead. In addition, advanced features are supported such as snoop ahead,

snoop filtering, L1 write-back forward to PCI master and L1 write-back merged with PCI post write buffers to minimize PCI master read latency and DRAM utilization. Delay transaction and read caching mechanisms are also implemented for further improvement of overall system performance.

The CLE266 North Bridge also integrates a VIA-designed 128-bit graphics accelerator into the chip. This brings mainstream graphics performance to the Value PC with leading-edge 2D, 3D and DVD video acceleration into a cost effective package. Based on its capabilities, the CLE266 is an ideal solution for the consumer, corporate desktop users and entry-level professionals.

The industry's first low-cost integrated AGP 8x solution to support DDR memory, the CLE266 North Bridge combines internal AGP 8x equivalent performance with massive 2Kx2K textures to deliver unprecedented performance and image quality for the Value PC desktop market.

The 376-pin Ball Grid Array VT8233A Client V-Link PCI / LPC controller supports four levels (doublewords) of line buffers, type F DMA transfers and delay transaction to allow efficient PCI bus utilization and (PCI-2.1 compliant). The VT8233A integrated PCI controller and PCI arbitration for up to five PCI slots. One of the PCI REQ / GNT pairs can be configured as high-priority to better support a low latency PCI bus master device.

The VT8233A also includes an integrated keyboard controller with PS2 mouse support, integrated DS12885 style real time clock with extended 256 byte CMOS RAM, integrated master mode enhanced IDE controller with full scatter / gather capability and extension to UltraDMA-133 / 100 / 66 / 33 for 133 / 100 / 66 / 33 MB/sec transfer rate, integrated USB interface with two root hubs and four functional ports with built-in physical layer transceivers, Distributed DMA support and OnNow / ACPI compliant advanced configuration and power management interface.

System Power Management

For sophisticated power management, the CLE266 provides independent clock stop control for the CPU / SDRAM and PCI and CKE control for powering down of the SDRAM. A separate suspend-well plane is implemented for the SDRAM control signals for Suspend-to-DRAM operation. Using the CLE266 North Bridge coupled with the VT8233A South Bridge, a complete power conscious PC main board can be implemented with no external TTLs.

High-Performance 3D Accelerator

Featuring an internal 128-bit 3D graphics engine, the CLE266 North Bridge utilizes a single cycle architecture that provides high performance along with superior image quality. Several new features enhance the 3D architecture, including single-pass multitexturing, anisotropic filtering and an 8-bit stencil buffer. The chip also offers the industry's only simultaneous usage of single-pass multitexturing and single-cycle trilinear filtering – enabling stunning image quality without performance loss. Image quality is further enhanced with true 32-bit color rendering throughout the 3D pipeline to produce more vivid and realistic images. The advanced triangle setup engine provides industry leading 3D performance for a realistic user experience in games and other interactive 3D applications. The 3D engine is optimized for AGP texturing from system memory.

128-bit 2D Graphics Engine

The CLE266 North Bridge advanced 128-bit 2D graphics engine delivers high-speed 2D acceleration for productivity applications. The enhanced 2D architecture optimizes SMA performance and provides acceleration of all color depths.

DVD Playback and Video Conferencing

The CLE266 North Bridge provides the ideal architecture for high quality MPEG-2 based DVD applications and video conferencing. For DVD playback, the integrated video accelerator offloads the CPU by performing the planar to packed format conversion and motion compensation tasks, while it is enhanced scaling algorithm delivers incredible full-screen video playback. For video conferencing, multiple video windows enable a cost effective solution.

TV Display Output Support

The CLE266 North Bridge provides an interface to an external TV Encoder (VIA VT1621, VT1622 or compatible).

Video Capture Interface

The CLE266 North Bridge provides a VIP 2.0-compatible interface to allow capture of video from an external source. This interface can be configured as one 8-bit, one 16-bit or two 8-bit ports.

LCD, Flat Panel Monitor and TV Output Display Support

The CLE266 North Bridge supports a wide variety of LCD panels through a direct interface up to 24-bits wide. This includes support for VGA, SVGA, XGA, SXGA+, UXGA and UXGA+ TFT color panels with 18-bit and 24-bit interfaces (both 1 pixel/clock and 2 pixels/clock for both 18 and 24-bit interfaces). The CLE266 North Bridge supports UXGA (1600x1200) and higher resolutions only with the VIA VT1631 LVDS Transmitter chip since the VT1631 supports dual-edge data transfer.

In addition to the 24-bit panel interface, also provided is a 12-bit interface to a TMDS encoder. This interface is Digital Visual Interface (DVI) 1.0 compliant for driving an external flat panel monitor. The pins of the DVI port can optionally be configured for support of an external TV-Encoder for display of video on a TV display. An alternate configuration, however, allows the upper bits of the 24-bit direct flat panel interface to be configured as a DVI interface with display resolution support up to 1280x1024. This allows both TV out and DVI capability at the same time with the lower bits of the flat panel interface configured for either an 8-bit direct panel interface, a second 8-bit video capture port or an extension of the basic 8-bit capture port to 16 bits.

Available display interface combinations:

- CRT + DVI + TV-Out + 8-Bit or 16-Bit Video Capture Port
- CRT + DVI + TV-Out + Two 8-Bit Video Capture Ports
- CRT + 24-bit LCD Panel + DVI or TV-Out + 8-bit Video Capture Port

High Screen Resolution CRT Support

Resolutions Supported	System Memory Frame Buffer Size		
	8 MB	16/32 MB	64 MB
VGA - 640x480x8/16/32	✓	✓	✓
SVGA - 800x600x8/16/32	✓	✓	✓
XGA - 1024x768x8/16/32	✓	✓	✓
SXGA - 1280x1024x8	✓	✓	✓
SXGA - 1280x1024x16	✓	✓	✓
SXGA - 1280x1024x32	✓	✓	✓
SXGA+ - 1400x1050x8	✓	✓	✓
SXGA+ - 1400x1050x16	✓	✓	✓
SXGA+ - 1400x1050x32	✓	✓	✓

Note: WHQL's DCT certification requires frame buffer size to be 16MB or above. For non-Window based applications, CLE266 supports 8MB frame buffer to reserve more available memory space for the system. Please refer to the register setting of Device 0 Offset E1[6:4] for more details.

Center **GND** Pins (37 pins): G13, L11-16, M11-16, N11-16, P11-16, R11-16, T11-16

Pin Descriptions

Table 4. Pin Descriptions

CPU Interface																					
Signal Name	Pin #	I/O	Signal Description																		
HA[31:3]#	(see pin list)	IO	Host Address Bus. HA[31:3] connect to the address bus of the host CPU. During CPU cycles HA[31:3] are inputs. These signals are driven by the CLE266 North Bridge during cache snooping operations.																		
HD[63:0]#	(see pin list)	IO	Host CPU Data. These signals are connected to the CPU data bus.																		
ADS#	AA25	IO	Address Strobe. The CPU asserts ADS# in T1 of the CPU bus cycle.																		
BNR#	R22	IO	Block Next Request. Used to block the current request bus owner from issuing new requests. This signal is used to dynamically control the processor bus pipeline depth.																		
BPRI#	T26	IO	Priority Agent Bus Request. The owner of this signal will always be the next bus owner. This signal has priority over symmetric bus requests and causes the current symmetric owner to stop issuing new transactions unless the HLOCK# signal is asserted. The CLE266 North Bridge drives this signal to gain control of the processor bus.																		
DBSY#	W24	IO	Data Bus Busy. Used by the data bus owner to hold the data bus for transfers requiring more than one cycle.																		
DEFER#	U23	IO	Defer. A dynamic deferring policy is used to optimize system performance. The DEFER# signal is also used to indicate a processor retry response.																		
DRDY#	Y26	IO	Data Ready. Asserted for each cycle that data is transferred.																		
HIT#	W23	IO	Hit. Indicates that a caching agent holds an unmodified version of the requested line. Also driven in conjunction with HITM# by the target to extend the snoop window.																		
HITM#	V23	I	Hit Modified. Asserted by the CPU to indicate that the address presented with the last assertion of EADS# is modified in the L1 cache and needs to be written back.																		
HLOCK#	V25	I	Host Lock. All CPU cycles sampled with the assertion of HLOCK# and ADS# until the negation of HLOCK# must be atomic.																		
HREQ[4:0]#	T25, V24, U26, T23, U24	IO	Request Command. Asserted during both clocks of the request phase. In the first clock, the signals define the transaction type to a level of detail that is sufficient to begin a snoop request. In the second clock, the signals carry additional information to define the complete transaction type.																		
HTRDY#	W25	IO	Host Target Ready. Indicates that the target of the processor transaction is able to enter the data transfer phase.																		
RS[2:0]#	Y25, V26, W26	IO	Response Signals. Indicates the type of response per the table below: <table><tr><th>RS[2:0]#</th><th>Response type</th></tr><tr><td>000</td><td>Idle State</td></tr><tr><td>001</td><td>Retry Response</td></tr><tr><td>010</td><td>Defer Response</td></tr><tr><td>011</td><td>Reserved</td></tr><tr><td>100</td><td>Hard Failure</td></tr><tr><td>101</td><td>Normal Without Data</td></tr><tr><td>110</td><td>Implicit Writeback</td></tr><tr><td>111</td><td>Normal With Data</td></tr></table>	RS[2:0]#	Response type	000	Idle State	001	Retry Response	010	Defer Response	011	Reserved	100	Hard Failure	101	Normal Without Data	110	Implicit Writeback	111	Normal With Data
RS[2:0]#	Response type																				
000	Idle State																				
001	Retry Response																				
010	Defer Response																				
011	Reserved																				
100	Hard Failure																				
101	Normal Without Data																				
110	Implicit Writeback																				
111	Normal With Data																				
CPURST#	H24	O	CPU Reset. Reset output to CPU. External pullup and filter capacitor to ground should be provided per CPU manufacturer's recommendations.																		
BREQ0#	AA26	O	Bus Request 0. Bus request output to CPU.																		

Note: Clocking of the CPU interface is performed with HCLK.

Note: Internal pullup resistors are provided on all GTL interface pins. If the CPU does not have internal pullups, the North Bridge internal pullups may be enabled to allow the interface to meet GTL bus interface specifications (see strap descriptions).

The pinouts were defined assuming the ATX PCB layout model shown below (and general pin layout shown) as a guide for PCB component placement. Other PCB layouts (AT, LPX and NLX) were also considered and can typically follow the same general component placement.

V-Link Interface						
Signal Name	Pin #	I/O	Signal Description			
VAD7,	V2	IO	Address/Data Bus.			
VAD6,	V1	IO				
VAD5,	R1	IO				
VAD4,	V3	IO	<u>Strap</u>	<u>Function</u>	<u>Setting (L=strap low, H=strap high)</u>	<u>Register</u> <u>SB Pin</u>
VAD3 / strap,	R4	IO	VAD3	GTL Pullup Enable	L=Disable, H=Enable	Rx50[6] SA19
VAD2 / strap,	U1	IO	VAD2	IOQ Depth	L=1-Level, H=8-Level	Rx50[7] SA18
VAD1 / strap,	P3	IO	VAD1	CPU FSB Clock Msb	LL=66 MHz, LH=100 MHz	Rx54[7] SA17
VAD0 / strap	P1	IO	VAD0	CPU FSB Clock Lsb	Hx=133 MHz	Rx54[6] SA16
VLPAR	U3	IO	Parity.			
VBE#	R5	IO	Byte Enable.			
VUPCMD	T5	I	Command from Client-to-Host.			
VUPSTB	T2	I	Strobe from Client-to-Host.			
VUPSTB#	T1	I	Complement Strobe from Client-to-Host.			
VDNCMD	T3	O	Command from Host-to-Client.			
VDNSTB	R2	O	Strobe from Host-to-Client.			
VDNSTB#	R3	O	Complement Strobe from Host-to-Client.			

DDR Synchronous DRAM Memory Interface			
Signal Name	Pin #	I/O	Signal Description
MD[63:0]	(see pinout tables)	IO	Memory Data. These signals are connected to the DRAM data bus. Output drive strength may be set by Device 0 Rx6D[1-0].
MA[14:0]	AC19, AC17, AD6, AB6, AC6, AB17, AC16, AB16, AD14, AC14, AC13, AB13, AC11, AD11, AD10	O	Memory Address. DRAM address lines. Output drive strength may be set by Device 0 Rx6C[7-6].
CS[3:0]#	W4, AC3, Y3, AA4	O	Chip Select. Chip select of each bank. Output drive strength may be set by Device 0 Rx6D[3-2].
DQM[7:0]	AB2, AF3, AF7, AE11, AC15, AF18, AD22, AD25	O	Data Mask. Data mask of each byte lane. Output drive strength may be set by Device 0 Rx6D[5-4].
DQS[7:0]#	AB1, AE3, AD7, AF11, AD15, AE18, AF22, AD26	IO	DDR Data Strobe. Data strobe of each byte lane. Output drive strength may be set by Device 0 Rx6C[3-2].
SRAS#	AD5	O	Row Address Command Indicator. Output drive strength may be set by Device 0 Rx6C[7-4].
SCAS#	AB4	O	Column Address Command Indicator. Output drive strength may be set by Device 0 Rx6C[7-4].
SWE#	AB5	O	Write Enable Command Indicator. Output drive strength may be set by Device 0 Rx6C[7-4].
CKE[3:0]	AD23, AC21, AC22, AC20	O	Clock Enables. Clock enables for each DRAM bank for powering down the SDRAM or clock control for reducing power usage and for reducing heat / temperature in high-speed memory systems. See Device 0 Rx6B[4].

SMB / I2C Interface			
Signal Name	Pin #	I/O	Signal Description
SPCLK[2:1]	A8, E9	IO	Serial Port (SMB/I2C) Clocks. These are the clocks for serial data transfer. SPCLK1 is typically used for DDC communications with a CRT monitor. As an output, it is programmed via CRA0[0]. As an input, its status is read via CRA0[2]. In either case the serial port must be enabled by CRA0[4] = 1. SPCLK2 is typically used for I ² C communications. As an output, it is programmed via CRB1[0]. As an input, its status is read via CRB1[2]. The port is enabled via CRB1[4] = 1.
SPDAT[2:1]	C9, D9	IO	Serial Port (SMB/I2C) Data. These are the data signals used for serial data transfer. SPDAT1 is typically used for DDC communications with a CRT monitor. As an output, it is programmed via CRA0[1]. As an input, its status is read via CRA0[3]. In either case the serial port must be enabled by CRA0[4] = 1. SPDAT2 is typically used for I ² C communications. As an output, it is programmed via CRB1[1]. As an input, its status is read via CRB1[3]. The port is enabled via CRB1[4] = 1.

Digital Monitor (DVI) Interface			
Signal Name	Pin #	I/O	Signal Description
DVID11 / TVD11, DVID10 / TVD10, DVID09 / TVD9, DVID08 / TVD8, DVID07 / TVD7, DVID06 / TVD6, DVID05 / TVD5, DVID04 / TVD4, DVID03 / TVD3, DVID02 / TVD2, DVID01 / TVD1, DVID00 / TVD0	D6 C6 A5 B5 C5 A4 B4 C4 A3 B3 A2 B2	O	Digital Monitor Data Out. Internally pulled down during reset
DVICLK / TVCLK	C2	O	Digital Monitor Clock Out. Internally pulled down during reset
DVIHS / TVHS	B1	O	Digital Monitor Horizontal Sync. Internally pulled down during reset
DVIVS / TVVS	A1	O	Digital Monitor Vertical Sync. Internally pulled down during reset
DVIDE / TVBL#	D5	O	Digital Monitor Display Enable. Indicates valid data on DVID[11:0]. Internally pulled down during reset
DVIDET / NC	C1	I	Digital Monitor Detect. Rx?? will read 1 if a digital monitor is connected. Must be tied to GND if not used.

TV Encoder Interface			
Signal Name	Pin #	I/O	Signal Description
TVD11 / DVID11, TVD10 / DVID10, TVD9 / DVID09, TVD8 / DVID08, TVD7 / DVID07, TVD6 / DVID06, TVD5 / DVID05, TVD4 / DVID04, TVD3 / DVID03, TVD2 / DVID02, TVD1 / DVID01, TVD0 / DVID00	D6 C6 A5 B5 C5 A4 B4 C4 A3 B3 A2 B2	O	TV Encoder Data. Internally pulled down during reset
TVCLKR / NC	C3	I	TV Encoder Clock In. Input clock from encoder. Internally pulled down.
TVCLK / DVICLK	C2	O	TV Encoder Clock Out. Output clock to TV encoder. Internally pulled down.
TVHS / DVIHS	B1	O	TV Encoder Horizontal Sync. Internally pulled down during reset
TVVS / DVIVS	A1	O	TV Encoder Vertical Sync. Internally pulled down during reset
TVBL# / DVIDE	D5	O	TV Encoder Blanking. Internally pulled down during reset

CRT Interface			
Signal Name	Pin #	I/O	Signal Description
AR	C10	A	Analog Red. Analog red output to the CRT monitor.
AB	A10	A	Analog Blue. Analog blue output to the CRT monitor.
AG	B10	A	Analog Green. Analog green output to the CRT monitor.
HSYNC	A9	O	Horizontal Sync. Output to CRT.
VSYNC	B9	O	Vertical Sync. Output to CRT.
RSET	A11	A	Reference Resistor. Tie to GNDRGB through an external $147\ \Omega \pm 1\%$ resistor to control the RAMDAC full-scale current value.

Direct LCD Panel Interface						
Signal Name	Pin #	I/O	Signal Description			
FPD23 / DFD07, strap,	N4	O	Flat Panel Data Out. Bits 8-22 also function as strap inputs that are sampled on the rising edge of RESET#. These straps are defined per the table below. “L” indicates strap low (4.7KΩ to ground), “H” = strap high (4.7KΩ to 10KΩ t 3.3V). See Design Guide for details.			
FPD22 / DFD11 / strap,	N2	O				
FPD21 / DFD10 / strap,	N1	O				
FPD20 / DFD09 / strap,	N3	O				
FPD19 / DFD08 / strap,	M3	O				
FPD18 / DFD07 / strap,	M1	O	<u>Strap</u>	<u>Function</u>	<u>Setting</u>	<u>Register</u>
FPD17 / DFD06 / strap,	M2	O	FPD22	Reserved for Test	Always Strap Low	–
FPD16 / DFD05 / strap,	M4	O				
FPD15 / DFD04 / strap,	L1	O	FPD21-20	TV Mode	LL=PAL, LH=NTSC,	EXSR13[4:3]
FPD14 / DFD03 / strap,	L2	O			HL=PAL-N, HH=PAL-NC	
FPD13 / DFD02 / strap,	L3	O	FPD19	TV # of Lines	L=525 Lines, H=625 Lines	EXSR12[6]
FPD12 / DFD01 / strap,	L4	O				
FPD11 / DFD00 / strap,	K4	O	FPD18	DVI Port Configuration	L=DVI, H=TV	EXSR12[5]
FPD10 / DFDE / strap,	K1	O	FPD17	Panel Interface Config	L=DVI / Capture, H=Panel	EXSR12[4]
FPD9 / DFHS / strap,	K2	O	FPD16-13	Panel Type	Customer Defined (contact VIA)	EXSR12[3:0]
FPD8 / DFVS / strap,	K3	O				
FPD7 / CPD15,	J1	O	FPD12	Reserved for Test	Always Strap Low	–
FPD6 / CPD14,	J2	O	FPD11	Reserved for Test	Always Strap Low	–
FPD5 / CPD13,	H1	O	FPD10	Reserved for Test	Always Strap Low	–
FPD4 / CPD12,	H2	O	FPD9	Reserved for Test	Always Strap Low	–
FPD3 / CPCK1,	H3	O	FPD8	Reserved for Test	Always Strap Low	–
FPD2 / CPD11,	G1	O				
FPD1 / CPD10,	G2	O				
FPD0 / CPD09	G3	O				
FPVS / CPVS	F3	O	Flat Panel Vertical Sync. Internally pulled down.			
FPHS / CPHS	F2	O	Flat Panel Horizontal Sync. Internally pulled down.			
FPDE / CPD08	F1	O	Flat Panel Data Enable. Internally pulled down.			
FPCLK / DFCLK	J3	O	Flat Panel Clock. Internally pulled down during reset.			
ENVDD	G4	O	Enable VDD. This signal is driven high to initiate a flat panel power up sequence.			
ENVEE	G5	O	Enable VEE. This signal is driven high for a programmable time after ENVDD is driven high during a flat panel power up sequence.			
ENBLT	H5	O	Enable Backlight.			

Video Capture Interface			
Signal Name	Pin #	I/O	Signal Description
CPD15 / FPD7, CPD14 / FPD6, CPD13 / FPD5, CPD12 / FPD4, CPD11 / FPD2, CPD10 / FPD1, CPD09 / FPD0, CPD08 / FPDE, CPD07, CPD06, CPD05, CPD04, CPD03, CPD02, CPD01, CPD00	J1 J2 H1 H2 G1 G2 G3 F1 F4 E4 E1 E2 D1 D2 D3 D4	I	Flat Panel Data Out.
CPVS / FPVS	F3	I	Video Capture Vertical Sync. Internally pulled down.
CPHS / FPHS	F2	I	Video Capture Horizontal Sync. Internally pulled down.
CPCLK	E3	I	Video Capture Clock 0. Clock for capture data inputs 0-7 (or 0-15 when capture port is configured as 16-bit)
CPCCK1 / FPD3	H3	I	Video Capture Clock 1. Clock for capture data inputs 8-15 when used as a second 8-bit capture port.

Note: The Video Capture Port may always be used in 8-bit input mode. The “upper” data bits (CPD[15:8]) may be used as a 16-bit extension or as a second 8-bit port if the 24-bit direct flat panel interface is not used.

Alternate Digital Monitor (DVI) Interface			
Signal Name	Pin #	I/O	Signal Description
DFD11 / FPD22, DFD10 / FPD21, DFD09 / FPD20, DFD08 / FPD19, DFD07 / FPD18, DFD06 / FPD17, DFD05 / FPD16, DFD04 / FPD15, DFD03 / FPD14, DFD02 / FPD13, DFD01 / FPD12, DFD00 / FPD11	N2 N1 N3 M3 M1 M2 M4 L1 L2 L3 L4 K4	O	Digital Monitor Data Out.
DFCLK / FPCLK	J3	O	Digital Monitor Clock. Internally pulled down during reset.
DFHS / FPD9	K2	O	Digital Monitor Horizontal Sync. Internally pulled down during reset
DFVS / FPD8	K3	O	Digital Monitor Vertical Sync. Internally pulled down during reset
DFDE / FPD10	K1	O	Digital Monitor Display Enable. Indicates valid data on DFD[11:0]. Internally pulled down during reset
DFDET / FPD23	N4	O	Digital Monitor Detect. Rx?? will read 1 if a digital monitor is connected. Must be tied to GND if not used.

Note: All “DFxxx” pins perform the same function as the “DMxxx” pins (the other DVI interface muxed with the TV-out pins).

Clocks, Resets, Power Control, General Purpose I/O, Interrupts and Test			
Signal Name	Pin #	I/O	Signal Description
HCLK	Y23	I	Host Clock. This pin receives the host CPU clock (100 / 133 MHz). This clock is used by all CLE266 logic that is in the host CPU domain.
MCLK	AB23	O	Memory (SDRAM) Clock. Output from the internal clock generator to the external clock buffer.
MCLKFB	AC23	I	Memory (SDRAM) Clock Feedback. Input from the external clock buffer.
DCLKI	H4	I	Dot Clock (Pixel Clock) In. Used for external EMI reduction circuit if used. Loop back from DCLKO if external EMI reduction circuit not implemented.
DCLKO	J4	O	Dot Clock (Pixel Clock) Out. Used for external EMI reduction circuit if used. Loop back to DCLKI if external EMI reduction circuit not implemented.
XIN	E12	I	Reference Frequency Input. 14.31818 MHz reference clock input for the internal graphics controller Phase Locked Loops (PLLs). All internal graphics controller clocks are synthesized on chip using this frequency as a reference.
RESET#	W3	I	Reset. When asserted low, this signal resets the internal logic of the chip and sets all register bits to their default values. The rising edge of this signal is used to sample all power-up strap options. Normally driven by the South Bridge.
PWROK	W1	I	Power OK. When asserted high, this signal indicates that system voltages are correct and stable. Driven by on-board Power Good circuitry. Also connected to the chipset South Bridge.
SUSST#	W2	I	Suspend Status. For implementation of the Suspend-to-DRAM feature. Normally driven by the South Bridge. Connect to an external pullup if not used.
INTA#	B6	O	Interrupt. PCI interrupt output (handled by the interrupt controller in the South Bridge)
AGPBUSY#	B8	O	AGP Interface Busy. Connect to a South Bridge GPIO pin for monitoring the status of the internal AGP bus. See CLE266 Design Guide for details.
GPIO0	D7	O	General Purpose Input / Output 0.
GPIO1	E7	O	General Purpose Input / Output 1.
GPIO2	D8	O	General Purpose Input / Output 2.
GPIO3	E8	O	General Purpose Input / Output 3.
AGPSTOP#	C8	I	AGP Stop. Assert low to stop the internal AGP interface (for power measurement only, not used in normal operation)
AGPSTDBY	A7	I	AGP Standby. Assert high to put the internal AGP interface into standby mode (for power measurement only, not used in normal operation)
AGPSUSP	C7	I	AGP Suspend. Assert high to put the internal AGP interface into suspend mode (for power measurement only, not used in normal operation)
GCLK	P4	I	Graphics Clock. 66 MHz clock from system clock synthesizer.
BISTIN	B7	I	BIST (Built-In-Self-Test) In. This pin is used for testing and must be tied low on all board designs.
DFTIN	A6	I	DFT (Design-For-Test) In. This pin is used for testing and must be tied low on all board designs.
NC	AB10, AC10	—	No Connect. Do not connect. Reserved for future use.

Power, Ground and Test			
Signal Name	Pin #	I/O	Signal Description
VTT	(see pin list)	P	Power for CPU I/O Interface Logic. Voltage is CPU dependent. See CLE266 Design Guide for details.
GTLVREF	E20, T22	P	CPU Interface GTL+ Voltage Reference. 2/3 VTT $\pm 2\%$ typically derived using a resistive voltage divider. See CLE266 Design Guide for details.
VCCM	(see pin list)	P	Power for Memory I/O Interface Logic. 2.5 $\pm 5\%$.
MEMVREF	AB7, AB20	P	Memory Voltage Reference.
VCCVL	P7, R7, T7, U5, V5	P	Power for V-Link I/O Interface Logic. 2.5V $\pm 5\%$.
VLCOMP	V4	I	V-Link P-Channel Compensation. Connect 70 Ω 1% resistor to ground.
VLVREF	T4	P	V-Link Voltage Reference. 0.9V derived using a resistive voltage divider between VCC25 and ground (see Design Guide for details).
VCC25	(see pin list)	P	Power for Internal Digital Logic. 2.5V $\pm 5\%$.
VSUS25	W5	P	Suspend Power. 2.5V $\pm 5\%$.
VCCHCK	AA24	P	Power for Host CPU Clock DLL. 2.5V $\pm 5\%$.
VCCMCK	AB24	P	Power for Memory Clock DLL. 2.5V $\pm 5\%$.
VCCFP	(see pin table)	P	Power for Flat Panel, DVI, TV-Out and Video Capture Interfaces. 3.3V $\pm 5\%$.
VCCRGB	D10	P	Power for CRT RGB Outputs. 2.5V $\pm 5\%$.
VCCDAC	C11	P	Power for DAC Digital Logic. 2.5V $\pm 5\%$.
VCCPLL1	B12	P	Power for Graphics Controller PLL 1. 2.5V $\pm 5\%$.
VCCPLL2	D12	P	Power for Graphics Controller PLL 2. 2.5V $\pm 5\%$.
VCCPLL3	C13	P	Power for Graphics Controller PLL 3. 2.5V $\pm 5\%$.
GND	(see pin table)	P	Ground for Internal Digital Logic. Connect to primary PCB ground plane.
GNDHCK	Y24	P	Ground for Host CPU Clock Circuitry. Connect to main ground plain through a ferrite bead.
GNDMCK	AC24	P	Ground for Memory Clock Circuitry. Connect to main ground plain through a ferrite bead.
GNDRGB	B11	P	Connection Point for RGB Load Resistors.
GNDDAC	D11	P	Ground for DAC Digital Circuitry.
GNDPLL1	A12	P	Ground for Graphics Controller PLL 1.
GNDPLL2	C12	P	Ground for Graphics Controller PLL 2.
GNDPLL3	A13	P	Ground for Graphics Controller PLL 3.

REGISTERS

Register Overview

The following tables summarize the configuration and I/O registers. These tables also document the power-on default value (“Default”) and access type (“Acc”) for each register. Access type definitions used are RW (Read/Write), RO (Read/Only), “—” for reserved / used (essentially the same as RO) and RWC (or just WC) (Read / Write 1’s to Clear individual bits). Registers indicated as RW may have some read-only bits that always read back a fixed value (usually 0 if unused); registers designated as RWC or WC may have some read-only or read write bits (see individual register descriptions following these tables for details). All offset and default values are shown in hexadecimal unless otherwise indicated.

Table 5. Registers

I/O Ports

Port #	I/O Port	Default	Acc
0022	PCI / AGP Arbiter Disable	00	RW
0CFB-0CF8	Configuration Address	0000 0000	RW
0CFF-0CFC	Configuration Data	0000 0000	RW

Device 0 Registers - Host Bridge
Header Registers

Offset	Configuration Space Header	Default	Acc
1-0	Vendor ID	1106	RO
3-2	Device ID	3123	RO
5-4	Command	0006	RW
7-6	Status	0210	WC
8	Revision ID	0n	RO
9	Program Interface	00	RO
A	Sub Class Code	00	RO
B	Base Class Code	06	RO
C	-reserved-	00	—
D	Latency Timer	00	RW
E	Header Type	00	RO
F	Built In Self Test (BIST)	00	RO
13-10	Graphics Aperture Base	0000 0008	RW
14-2B	-reserved-	00	—
2D-2C	Subsystem Vendor ID	0000	W1
2F-2E	Subsystem ID	0000	W1
30-33	-reserved-	00	—
34	Capability Pointer	A0	RO
35-3F	-reserved-	00	—

Device-Specific Registers

Offset	V-Link Control	Default	Acc
40	V-Link Revision ID	00	RO
41	V-Link NB Capability	18	RO
42	V-Link NB Downlink Command	88	RW
44-43	V-Link NB Uplink Status	8280	RO
45	V-Link NB Bus Timer	44	RW
46	V-Link Misc NB Control	00	RW
47	V-Link Control	00	RW
48	V-Link NB/SB Configuration	18	RW
49	V-Link SB Capability	18	RW
4A	V-Link SB Downlink Status	88	RO
4C-4B	V-Link SB Uplink Command	8280	RW
4D	V-Link SB Bus Timer	44	RW
4E	CCA Master High Priority	00	RW
4F	V-Link SB Miscellaneous Control	00	RW

Offset	Host CPU Protocol Control	Default	Acc
50	CPU Interface Request Phase Control	20	RW
51	CPU Interface Basic Control	00	RW
52	CPU Interface Advanced Control	00	RW
53	CPU Interface Arbitration Control	03	RW

Miscellaneous I/O

One I/O port is defined: Port 22.

Port 22 – PCI / AGP Arbiter DisableRW

- 7-2 Reserved** always reads 0
- 1 AGP Arbiter Disable**
 - 0 Respond to GREQ# signaldefault
 - 1 Do not respond to GREQ# signal
- 0 PCI Arbiter Disable**
 - 0 Respond to all REQ# signals.....default
 - 1 Do not respond to any REQ# signals, including PREQ#

This port can be enabled for read/write access by setting bit-7 of Device 0 Configuration Register 78.

PCI Configuration Space I/O

All registers (listed above in the “register summary” section of this document) are addressed via the following configuration mechanism:

Mechanism #1

These ports respond only to double-word accesses. Byte or word accesses will be passed on unchanged.

Port CFB-CF8 - Configuration Address..... RW

- 31 Configuration Space Enable**
 - 0 Disabled..... default
 - 1 Convert configuration data port writes to configuration cycles on the PCI bus
- 30-24 Reserved**always reads 0
- 23-16 PCI Bus Number**
Used to choose a specific PCI bus in the system
- 15-11 Device Number**
Used to choose a specific device in the system (devices 0 and 1 are defined)
- 10-8 Function Number**
Used to choose a specific function if the selected device supports multiple functions (only function 0 is defined).
- 7-2 Register Number (also called the "Offset")**
Used to select a specific DWORD in the configuration space
- 1-0 Fixed**always reads 0

Port CFF-CFC - Configuration Data..... RW

Refer to PCI Bus Specification Version 2.2 for further details on operation of the above configuration registers.

Device 0 Register Descriptions

Device 0 Host Bridge Header Registers

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through 0CF8 / 0CFC with bus number, function number and device number equal to zero.

Device 0 Offset 1-0 - Vendor ID (1106h).....RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

Device 0 Offset 3-2 - Device ID (3123h).....RO

15-0 ID Code (reads 3123h to identify the CLE266 North Bridge chip)

Device 0 Offset 5-4 –Command (0006h).....RW

15-10 Reserved always reads 0

9 Fast Back-to-Back Cycle EnableRO

- 0 Fast back-to-back transactions only allowed to the same agent.....default
- 1 Fast back-to-back transactions allowed to different agents

8 SERR# Enable.....RO

- 0 SERR# driver disabled.....default
 - 1 SERR# driver enabled
- (SERR# is used to report ECC errors)

7 Address / Data Stepping.....RO

- 0 Device never does stepping.....default
- 1 Device always does stepping

6 Parity Error Response.....RW

- 0 Ignore parity errors & continue.....default
- 1 Take normal action on detected parity errors

5 VGA Palette Snoop.....RO

- 0 Treat palette accesses normally.....default
- 1 Don't respond to palette accesses on PCI bus

4 Memory Write and Invalidate Command.....RO

- 0 Bus masters must use Mem Write.....default
- 1 Bus masters may generate Mem Write & Inval

3 Special Cycle Monitoring.....RO

- 0 Does not monitor special cycles.....default
- 1 Monitors special cycles

2 PCI Bus Master.....RO

- 0 Never behaves as a bus master
- 1 Can behave as a bus master.....default

1 Memory Space.....RO

- 0 Does not respond to memory space
- 1 Responds to memory space.....default

0 I/O SpaceRO

- 0 Does not respond to I/O spacedefault
- 1 Responds to I/O space

Device 0 Offset 7-6 – Status (0210h)..... RWC

15 Detected Parity Error

- 0 No parity error detected..... default
- 1 Error detected in either address or data phase. This bit is set even if error response is disabled (command register bit-6).....**write one to clear**

14 Signaled System Error (SERR# Asserted)

.....always reads 0

13 Signaled Master Abort

- 0 No abort received default
- 1 Transaction aborted by the master **write one to clear**

12 Received Target Abort

- 0 No abort received default
- 1 Transaction aborted by the target **write one to clear**

11 Signaled Target Abortalways reads 0

- 0 Target Abort never signaled

10-9 DEVSEL# Timing

- 00 Fast
- 01 Medium **always reads 01**
- 10 Slow
- 11 Reserved

8 Data Parity Error Detected

- 0 No data parity error detected default
 - 1 Error detected in data phase. Set only if error response enabled via command bit-6 = 1 and The CLE266 was initiator of the operation in which the error occurred
-**write one to clear**

7 Fast Back-to-Back Capablealways reads 0

6 User Definable Features.....always reads 0

5 66MHz Capable.....always reads 0

4 Supports New Capability list..... **always reads 1**

3-0 Reservedalways reads 0

Device 0 Offset 8 - Revision ID (0nh)..... RO

7-0 Chip Revision Code.....always reads 0nh

Device 0 Offset 9 - Programming Interface (00h)..... RO

7-0 Interface Identifieralways reads 00h

Device 0 Offset A - Sub Class Code (00h)..... RO

7-0 Sub Class Codereads 00 to indicate Host Bridge

Device 0 Offset B - Base Class Code (06h)..... RO

7-0 Base Class Code..reads 06 to indicate Bridge Device

Device 0 Offset D - Latency Timer (00h)..... RW

Specifies the latency timer value in PCI bus clocks.

7-3 Guaranteed Time Slice for CPU default=0

2-0 Reserved (fixed granularity of 8 clks) .. always read 0
 Bits 2-1 are writeable but read 0 for PCI specification compatibility. The programmed value may be read back in Offset 75 bits 5-4 (PCI Arbitration 1).

Device 0 Host Bridge Header Registers (continued)
Device 0 Offset E - Header Type (00h).....RO

7-0 Header Type Code reads 00: single function

Device 0 Offset F - Built In Self Test (BIST) (00h).....RO

7 BIST Supportedreads 0: no supported functions

6-0 Reserved always reads 0

Device 0 Offset 13-10 - Graphics Aperture Base
(00000008h)RW

31-28 Upper Programmable Base Address Bits def=0

27-20 Lower Programmable Base Address Bits def=0

These bits behave as if hardwired to 0 if the corresponding Graphics Aperture Size register bit (Device 0 Offset 84h) is 0.

0	0	0	0	0	0	0	0	256M

19-0 Reserved always reads 00008

Note: The locations in the address range defined by this register are prefetchable.

Device 0 Host Bridge Header Registers (continued)
Device 0 Offset 2D-2C – Subsys Vendor ID (0000h)... W1/R

15-0 Subsystem Vendor ID default = 0
This register may be written once and is then read only.

Device 0 Offset 2F-2E – Subsystem ID (0000h)..... W1/R

15-0 Subsystem ID default = 0
This register may be written once and is then read only.

Device 0 Offset 34 - Capability Pointer (A0h)..... RO

Contains a byte offset from the start of configuration space.

7-0 AGP Capability List Pointeralways reads A0h

Device 0 Host Bridge Device-Specific Registers

These registers are normally programmed once at system initialization time.

V-Link Control

Device 0 Offset 40 – V-Link Specification ID (00h).....RO

7-0 Specification Revision..... always reads 00

Device 0 Offset 41 – NB V-Link Capability (18h)RO

7-6 Reserved always reads 0

5 16-bit Bus Width SupportedRO

0 Not Supporteddefault

DRAM Control

These registers are normally set at system initialization time and not accessed after that during normal system operation. Some of these registers, however, may need to be programmed using specific sequences during power-up initialization to properly detect the type and size of installed memory (refer to the CLE266 BIOS porting guide for details).

GART / Graphics Aperture Control

The function of the Graphics Address Relocation Table (GART) is to translate virtual 32-bit addresses issued by an AGP device into 4K-page based physical addresses for system memory access. In this translation, the upper 20 bits (A31-A12) are remapped, while the lower 12 address bits (A11-A0) are used unchanged.

A one-level fully associative lookup scheme is used to implement the address translation. In this scheme, the upper 20 bits of the virtual address are used to point to an entry in a page table located in system memory. Each page table entry contains the upper 20 bits of a physical address (a "physical page" address). For simplicity, each page table entry is 4 bytes. The total size of the page table depends on the GART range (called the "aperture size") which is programmable.

This scheme is shown in the figure below.

Figure 3. Graphics Aperture Address Translation

Since address translation using the above scheme requires an access to system memory, an on-chip cache (called a "Translation Lookaside Buffer" or TLB) is utilized to enhance performance. The on-chip TLB contains 16 entries. Address "misses" in the TLB require an access of system memory to retrieve translation data. Entries in the TLB are replaced using an LRU (Least Recently Used) algorithm.

Addresses are translated only for accesses within the "Graphics Aperture" (GA). The Graphics Aperture can be any power of two in size from 1MB to 256MB (i.e., 1MB, 2MB, 4MB, 8MB, etc). The base of the Graphics Aperture can be anywhere in the system virtual address space on an address boundary determined by the aperture size (e.g., if the aperture size is 4MB, the base must be on a 4MB address boundary). The Graphics Aperture Base is defined in register offset 10 of device 0. The Graphics Aperture Size and TLB Table Base are defined in the following register group (offsets 84 and 88 respectively) along with various control bits.

Device 0 Offset 83-80 - GART/TLB Control (00000000h) RW

Offset 85 – Write Policy (00h) RW

- 7 Reserved**always reads 0
- 6-4 Write Request Limit** default = 0
- 3 DRAM Bus Float When Idle**
 - 0 Disable..... default
 - 1 Enable
- 2-0 Write Request Base** default = 0

Offset 8B-88 - GA Translation Table Base (00000000h) RW

- 31-12 Graphics Aperture Translation Table Base.**
Pointer to the base of the translation table in system memory used to map addresses in the aperture range (the pointer to the base of the "Directory" table).
- 11-2 Reserved**always reads 0
- 1 Graphics Aperture A[31:28]**
 - 0 Disable..... default
 - 1 Enable

Note: To disable the Graphics Aperture, set this bit to 0 and set all bits of the Graphics Aperture Size to 0. To enable the Graphics Aperture, set this bit to 1 and program the Graphics Aperture Size to the desired aperture size.
- 0 Reserved**always reads 0

AGP Control

Device 0 Offset A3-A0 - AGP Capability Identifier

(0020C002h)		RO
31-24 Reserved	 always reads 00	
23-20 Major Specification Revision	 always reads 0010	
	Major rev # of AGP spec to which device conforms	
19-16 Minor Specification Revision	 always reads 0000	
	Minor rev # of AGP spec to which device conforms	
	Bits 23-16 indicate the device conforms to AGP 2.0	
15-8 Pointer to Next Item	 always reads C0h (last item)	
7-0 AGP ID	.. (always reads 02 to indicate it is AGP)	

Device 0 Offset A7-A4 - AGP Status (1F000207h)RO

31-24 Maximum AGP Requests	 always reads 1F†	
	Max # of AGP requests the device can manage (32)	
	† See also RxFC[1] and RxFD[2-0]	
23-10 Reserved	 always reads 0	
9 Supports Side Band Addressing	 always reads 1	
8-6 Reserved	 always reads 0	
5 4G Supported	 (can be written at RxAE[5])	
4 Fast Write Supported	 (can be written at RxAE[4])	
3 Reserved	 always reads 0	
2 4X Rate Supported	 always reads 1	
1 2X Rate Supported	 always reads 1	
0 1X Rate Supported	 always reads 1	

Device 0 Offset AB-A8 - AGP Command (00000000h)..RW

31-24 Request Depth (reserved for target) ..always reads 0s	
23-10 Reserved	always reads 0s
9 Side Band Addressing Enable	
	0 Disabledefault
	1 Enable
8 AGP Enable	
	0 Disabledefault
	1 Enable
7-6 Reserved	always reads 0s
5 4G Enable	
	0 Disabledefault
	1 Enable
4 Fast Write Enable	
	0 Disabledefault
	1 Enable

2 4X Mode Enable	
	0 Disabledefault
	1 Enable
1 2X Mode Enable	
	0 Disabledefault
	1 Enable
0 1X Mode Enable	
	0 Disabledefault
	1 Enable

Device 0 Offset AC - AGP Control (00h)..... RW

7 Reserved	always reads 0
6 AGP Read Synchronization	
	0 Disable..... default
	1 Enable
5 AGP Read Snoop DRAM Post-Write Buffer	
	0 Disable..... default
	1 Enable
4 GREQ# Priority Becomes Higher When Arbiter is Parked at AGP Master	
	0 Disable..... default
	1 Enable
3 2X Rate Supported	
	0 Disable..... default
	1 Enable
2 Fence / Flush	
	0 Disable – low priority requests may be executed out of order. default
	1 Enable – all normal priority AGP operations will be executed in order
1 AGP Grant Parking Policy	
	0 Non-Parking Grant – if GFRM# or GPIPE# is asserted, GGNT# is deasserted default
	1 Parking Grant – if GFRM# or GPIPE# is asserted, GGNT# is not de-asserted until GREQ# is deasserted or timeout
0 AGP to PCI Master or CPU to PCI Turnaround Cycle	
	0 2T or 3T Timing default
	1 1T Timing

Device 0 Offset AD – AGP Misc Control 1 (02h).....RW

- 7-6 Reserved** always reads 0
- 5 Input on AGP GD / GBE Pads**
 - 0 Disabledefault
 - 1 Enable
- 4 Choose First or Last Ready of DRAM**
 - 0 Last ready chosen.....default
 - 1 First ready chosen
- 3-0 AGP Data Phase Latency Timer** default = 02h

Device 0 Offset AE – AGP Misc Control 2 (00h) RW

- 7-6 Reserved**always reads 0
- 5 4G Supported**
 - 0 4G not supported default
 - 1 4G supported
- 4 Fast Write Supported**
 - 0 Fast Write not supported default
 - 1 Fast Write supported
- 3 Reserved**always reads 0
- 2 4X Rate Supported**
 - 0 Disable..... default
 - 1 Enable
- 1-0 Reserved**always reads 0

V-Link Control

Device 0 Offset B4 – V-Link NB Compensation Ctrl (00h)RW

- 7-6 V-Link Autocomp Output Value**..... always reads 0
- 5 Pullup Compensation Selection**
 - 0 Auto Comp (use values in bits 7-6).....default
 - 1 Manual Comp (use values in bits 3-2)
- 4 Pulldown Compensation Selection**
 - 0 Auto Comp (use values in bits 7-6).....default
 - 1 Manual Comp (use values in bits 1-0)
- 3-2 Pullup Compensation Manual Setting** def = 0
- 1-0 Pulldown Compensation Manual Setting** def = 0

Device 0 Offset B5 – V-Link NB Drive Control (00h)....RW

- 7-6 NB V-Link Strobe Pullup Manual Setting**
- 5-4 NB V-Link Strobe Pulldown Manual Setting**
- 3-1 Reserved** always reads 0

- 4 **AGP Interface Power Management**
 - 0 Disabledefault
 - 1 Enable
- 3 **Reserved** always reads 0
- 2 **Graphics Memory Interface Power Management**
 - 0 Disabledefault
 - 1 Enable
- 1 **Configuration Registers Power Management**
 - 0 Disabledefault
 - 1 Enable
- 0 **Reserved** always reads 0

Device 0 Offset BF – DRAM Pad Toggle Reduction (00h)RW

- 7 **MA / SCMD Pin Toggle Reduction**
 - 0 Disabledefault
 - 1 Enable (MA and S command pins won't toggle if not accessed)
- 6 **Slew Rate Control for MA / SCMD**
 - 0 Disabledefault
 - 1 Enable
- 5-0 **Reserved** always reads 0

Device 0 Offset C0 – Power Management Capability IDRO

- 7-0 **Capability ID**always reads 01h

Device 0 Offset C1 – Power Management Next Pointer. RO

- 7-0 **Next Pointer** always reads 00h (“Null” Pointer)

Device 0 Offset C2 – Power Mgmt Capabilities I RO

- 7-0 **Power Management Capabilities** ..always reads 02h

Device 0 Offset C3 – Power Mgmt Capabilities II..... RO

- 7-0 **Power Management Capabilities** ..always reads 00h

Device 0 Offset C4 – Power Mgmt Control / Status RW

- 7-2 **Reserved**always reads 0
- 1-0 **Power State**
 - 00 D0 default
 - 01 -reserved-
 - 10 -reserved-
 - 11 D3 Hot

Device 0 Offset C5 – Power Management Status..... RW

- 7-0 **Power Management Status** default = 00h

Device 0 Offset C6 – PCI-to-PCI Bridge Support Ext... RW

- 7-0 **P2P Bridge Support Extensions** default = 00h

Device 0 Offset C7 – Power Management Data RW

- 7-0 **Power Management Data** default = 00h

Frame Buffer and High Memory Control

Device 0 Offset E0 – CPU Direct Access FB Base (00h) RW

- 7-1 CPU Direct Access FB Base Address[27:21] . def=0
 0 CPU Direct Access Frame Buffer
 0 Disabledefault
 1 Enable

Device 0 Offset E1 – CPU Direct Access FB Size (00h)..RW

- 7 Internal VGA
 0 Disabledefault
 1 Enable

- 6-4 Frame Buffer Size
 000 Nonedefault
 001 -reserved-
 010 -reserved-
 011 8MB
 100 16MB
 101 32MB
 110 64MB
 111 -reserved-

Note: For WHQL certified driver, the frame buffer size is required to be 16MB or above.

- 3-0 CPU Direct Access FB Base Address[31:28] . def=0

Device 0 Offset E2 – VGA Arbitration Timer 1 (00h) ...RW

- 7-4 Timer for Promoted High Priority Display Requests def = 0

- 3-0 Timer for Promoted High Priority Display . def = 0

The fields above are defined in units of 16 memory (DRAM) clocks. (See also note under VGA Timer 2 description).

Device 0 Offset E3 – UMA Control (00h).....RW

- 7-5 Reserved always reads 0
 4 Frame Buffer Address Conversion
 0 Disabledefault
 1 Enable

Setting this bit further optimizes the MA table for VGA frame buffer accesses according to the DRAM page size in use. Setting this bit should improve VGA performance especially in tiling address mode. This bit cannot be used at the same time as CPU Direct Access FB mode. If used, this bit must be set before enabling the internal VGA to prevent display corruption.

- 3-2 Reserved always reads 0

- 1-0 Frame Buffer Bank

Device 0 Offset E6 – SMM / APIC Decoding (01h) RW

- 7-6 Reservedalways reads 0

- 5 Reserved (Do Not Program) default = 0

- 4 I/O APIC Decoding
 0 FECxxxxx accesses go to PCI..... default
 1 FEC00000 to FEC7FFFF accesses go to PCI
 FEC80000 to FECFFFFFF accesses go to AGP

- 3 MSI (Processor Message) Support
 0 Disable (master access to FEExxxxx will go to PCI) default
 1 Enable (master access to FEExxxxx will be passed to host side to do snoop)

- 2 Top SMM
 0 Disable..... default
 1 Enable

- 1 High SMM
 0 Disable..... default
 1 Enable

- 0 Compatible SMM
 0 Disable
 1 Enable..... default

Device 0 Offset E8 – VGA Arbitration Timer 2 (40h)... RW

- 7-4 Timer for Promoted Low Priority Display Requestsdefault = 0100b

- 3-0 Timer for Promoted Low Priority Display ..def = 0

The fields above are defined in units of 16 memory (DRAM) clocks.

VGA timers 1 and 2 are access arbitration timers between the display engine and the graphics engine. Normally the display engine has lower priority than the graphics engine unless the display buffer is below the threshold level where display requests become high priority. The VGA Timers provide the ability to override this default behavior. These bits should be set prior to turning on the VGA.

BIOS Scratch

Device 0 Offset F7-F0 – BIOS Scratch Registers RW

- 7-0 No hardware function default = 0

Device 1 Register Descriptions

Device 1 PCI-to-PCI Bridge Header Registers

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number of 0 and function number equal to 0 and device number equal to one.

Device 1 Offset 1-0 - Vendor ID (1106h).....RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

Device 1 Offset 3-2 - Device ID (B091h).....RO

15-0 ID Code (reads B091h to identify the on-chip PCI-to-PCI Bridge device)

Device 1 Offset 5-4 - Command (0007h).....RW

- 15-10 Reserved always reads 0
- 9 Fast Back-to-Back Cycle EnableRO
 - 0 Fast back-to-back transactions only allowed to the same agent.....default
 - 1 Fast back-to-back transactions allowed to different agents
- 8 SERR# Enable.....RO
 - 0 SERR# driver disabled.....default
 - 1 SERR# driver enabled
 (SERR# is used to report ECC errors)
- 7 Address / Data Stepping.....RO
 - 0 Device never does stepping.....default
 - 1 Device always does stepping
- 6 Parity Error Response..... RW
 - 0 Ignore parity errors & continue.....default
 - 1 Take normal action on detected parity errors
- 5 Reserved always reads 0
- 4 Memory Write and Invalidate CommandRO
 - 0 Bus masters must use Mem Write.....default
 - 1 Bus masters may generate Mem Write & Inval
- 3 Special Cycle Monitoring.....RO
 - 0 Does not monitor special cycles.....default
 - 1 Monitors special cycles
- 2 Bus Master RW
 - 0 Never behaves as a bus master
 - 1 Enable to operate as a bus master on the primary interface on behalf of a master on the secondary interfacedefault
- 1 Memory Space..... RW
 - 0 Does not respond to memory space
 - 1 Enable memory space accessdefault
- 0 I/O Space RW
 - 0 Does not respond to I/O space
 - 1 Enable I/O space accessdefault

Device 1 Offset 7-6 - Status (Primary Bus) (0230h).... RWC

- 15 Detected Parity Erroralways reads 0
- 14 Signaled System Error (SERR#).....always reads 0
- 13 Signaled Master Abort
 - 0 No abort received default
 - 1 Transaction aborted by the master with Master-Abort (except Special Cycles).....
write 1 to clear
- 12 Received Target Abort
 - 0 No abort received default
 - 1 Transaction aborted by the target with Target-Abortwrite 1 to clear
- 11 Signaled Target Abortalways reads 0
- 10-9 DEVSEL# Timing
 - 00 Fast
 - 01 Medium always reads 01
 - 10 Slow
 - 11 Reserved
- 8 Data Parity Error Detectedalways reads 0
- 7 Fast Back-to-Back Capablealways reads 0
- 6 User Definable Features.....always reads 0
- 5 66MHz Capable..... always reads 1
- 4 Supports New Capability list..... always reads 1
- 3-0 Reservedalways reads 0

Device 1 Offset 8 - Revision ID (0nh)..... RO

7-0 Chip Revision Code.....always reads 0nh

Device 1 Offset 9 - Programming Interface (00h)..... RO

This register is defined in different ways for each Base/Sub-Class Code value and is undefined for this type of device.

7-0 Interface Identifieralways reads 00

Device 1 Offset A - Sub Class Code (04h)..... RO

7-0 Sub Class Code .reads 04 to indicate PCI-PCI Bridge

Device 1 Offset B - Base Class Code (06h)..... RO

7-0 Base Class Code.. reads 06 to indicate Bridge Device

Device 1 Offset D - Latency Timer (00h)..... RO

7-0 Reservedalways reads 0

Device 1 Offset E - Header Type (01h)..... RO

7-0 Header Type Code..... reads 01: PCI-PCI Bridge

Device 1 Offset 18 - Primary Bus Number (00h).....RW

7-0 Primary Bus Number default = 0
This register is read write, but internally the chip always uses bus 0 as the primary.

Device 1 Offset 19 - Secondary Bus Number (00h)RW

7-0 Secondary Bus Number default = 0
Note: AGP must use these bits to convert Type 1 to Type 0.

Device 1 Offset 1A - Subordinate Bus Number (00h)RW

7-0 Primary Bus Number default = 0
Note: AGP must use these bits to decide if Type 1 to Type 1 command passing is allowed.

Device 1 Offset 1B – Secondary Latency Timer (00h)RO

7-0 Reserved always reads 0

Device 1 Offset 1C - I/O Base (F0h).....RW

7-4 I/O Base AD[15:12] default = 1111b
3-0 I/O Addressing Capability default = 0

Device 1 Offset 1D - I/O Limit (00h).....RW

7-4 I/O Limit AD[15:12] default = 0
3-0 I/O Addressing Capability default = 0

Device 1 Offset 1F-1E - Secondary Status.....RO

15-0 Secondary Status
Rx44[4] = 0: these bits read back 0000h
Rx44[4] = 1: these bits read back same as Rx7-6

Device 1 Offset 21-20 - Memory Base (FFF0h).....RW

15-4 Memory Base AD[31:20] default = FFFh
3-0 Reserved always reads 0

Device 1 Offset 23-22 - Memory Limit (Inclusive) (0000h) RW

15-4 Memory Limit AD[31:20] default = 0
3-0 Reserved always reads 0

Device 1 Offset 25-24 - Prefetchable Memory Base (FFF0h)RW

15-4 Prefetchable Memory Base AD[31:20] ..def = FFFh
3-0 Reserved always reads 0

Device 1 Offset 27-26 - Prefetchable Memory Limit (0000h)RW

15-4 Prefetchable Memory Limit AD[31:20] def = 0
3-0 Reserved always reads 0

Device 1 Offset 34 - Capability Pointer (80h)..... RO

Contains a byte offset from the start of configuration space.

7-0 AGP Capability List Pointer always reads 80h

Device 1 Offset 3F-3E – PCI-to-PCI Bridge Control (0000h) RW

15-4 Reservedalways reads 0

3 VGA-Compatible I/O and Memory Addresses

- 0 Do not forward VGA accesses default
- 1 Forward VGA accesses

Note: VGA addresses are memory A0000-BFFFFh and I/O addresses 3B0-3BBh, 3C0-3CFh and 3D0-3DFh (10-bit decode). "Mono" text mode uses B0000-B7FFFh and "Color" Text Mode uses B8000-BFFFFh. Graphics modes use Axxxxh. Mono VGA uses I/O addresses 3Bx-3Cxh and Color VGA uses 3Cx-3Dxh. If an MDA is present, a VGA will not use the 3Bxh I/O addresses and B0000-B7FFFh memory space; if not, the VGA will use those addresses to emulate MDA modes.

2 Block / Forward ISA I/O Addresses

- 0 Forward all I/O accesses to the AGP bus if they are in the range defined by the I/O Base and I/O Limit registers (device 1 offset 1C-1D) default
- 1 Do not forward I/O accesses to the AGP bus that are in the 100-3FFh address range even if they are in the range defined by the I/O Base and I/O Limit registers.

1-0 Reservedalways reads 0

Device 1 PCI-to-PCI Bridge Device-Specific Registers
Internal AGP Bus Control
Device 1 Offset 40 - CPU-to-AGP Flow Control 1 (00h) RW

- 7 CPU-AGP Post Write**
0 Disabledefault
1 Enable
- 6 Reserved** always reads 0
- 5 CPU-AGP One Wait State Burst Write**
0 Disabledefault
1 Enable
- 4-3 Read Prefetch Control**
00 Always prefetchdefault
10 Prefetch only for "Enhance" command
x1 Prefetch Disable
- 2 MDA Present on AGP**
0 Forward MDA accesses to AGPdefault
1 Forward MDA accesses to PCI
Note: Forward despite IO / Memory Base / Limit
Note: MDA (Monochrome Display Adapter) addresses are memory addresses B0000h-B7FFFh and I/O addresses 3B4-3B5h, 3B8-3BAh and 3BFh (10-bit decode). 3BC-3BE are reserved for printers.
Note: If Rx3E bit-3 is 0, this bit is a don't care (MDA accesses are forwarded to the PCI bus).
- 1 AGP Master Read Caching**
0 Disabledefault
1 Enable
- 0 AGP Delay Transaction**
0 Disabledefault
1 Enable

Device 1 Offset 41 - CPU-to-AGP Flow Control 2 (08h) RW

- 7 Retry Status**
0 No retry occurred..... default
1 Retry Occurred**write 1 to clear**
- 6 Retry Timeout Action**
0 No action taken except to record status def
1 Flush buffer for write or return all 1s for read
- 5-4 Retry Count**
00 Retry 2, backoff CPU default
01 Retry 4, backoff CPU
10 Retry 16, backoff CPU
11 Retry 64, backoff CPU
- 3 CPU-to-AGP Bursting Timeout**
0 Disable
1 Enable..... **default**
- 2 Reserved**always reads 0
- 1 CPU-to-PCI/AGP Cycles Invalidate PCI/AGP Buffered Read Data**
0 Disable..... default
1 Enable
- 0 AGP Read Bursting**
0 Disable..... default
1 Enable

Table 9. VGA / MDA Memory / IO Redirection

FUNCTIONAL DESCRIPTION

Integrated Graphics Controller

Figure 4. Graphics Controller Internal Block Diagram

Internal Architecture

A high-level block diagram of the integrated graphics controller core is shown in Figure 4 above. This diagram is intended to be used for gaining an understanding of chip features and programming. It shows logical structure but is not intended to show actual internal implementation details.

Graphics Modes

Mode support is influenced by:

- Amount, speed and bus width of video memory
- Display resolution and color depth
- Maximum refresh capability detected for the display devices
- Panel Size
- Single IGA or Dual IGA setting
- SAMM setting

Desktop Modes - Single Display

LCD Single Display modes follow the 60Hz refresh column in the table below.

		CRT MAXIMUM REFRESH

Graphics Modes That Allow LCD Centering and Expansion

When the LCD resolution is smaller than the panel's native resolution, software and hardware may activate centering or expansion depending on the display setting, using the high quality interpolated scaler.

RESOLUTION	LCD NATIVE RESOLUTION			
	LCD XGA 1024x768	LCD WXGA 1280x1024	LCD SXGA+ 1400x1050	LCD UXGA 1600x1200

ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

Table 22. Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Unit	Notes
T _C	Case operating temperature	0	85	°C	1
T _S	Storage temperature	-55	125	°C	1
V _{IN}	Input voltage	-0.5	V _{RAIL} + 10%	Volts	1, 2
V _{OUT}	Output voltage	-0.5	V _{RAIL} + 10%	Volts	1, 2

Note 1. Stress above the conditions listed may cause permanent damage to the device. Functional operation of this device should be restricted to the conditions described under operating conditions.

Note 2. V_{RAIL} is defined as the V_{CC} level of the respective rail. The CPU interface can be 3.3V or 2.5V. Memory can be 3.3V only. PCI can be 3.3V or 5.0V. Video can be 3.3V or 5.0V. Flat Panel can be 3.3V only. AGP can be 1.5V (4x transfer mode) or 3.3V (2x transfer mode).

DC Characteristics

T_C = 0-85°C, V_{RAIL} = V_{CC} ±5%, V_{CORE} = 2.5V ±5%, GND=0V

Table 23. DC Characteristics

Symbol	Parameter	Min	Max	Unit	Condition
V _{IL}	Input Low Voltage	-0.50	0.8	V	
V _{IH}	Input High Voltage	2.0	V _{CC} +0.5	V	
V _{OL}	Output Low Voltage	—	0.55	V	I _{OL} = 4.0mA
V _{OH}	Output High Voltage	2.4	—	V	I _{OH} = -1.0mA
I _{IL}	Input Leakage Current	—	±10	uA	0 < V _{IN} < V _{CC}
I _{OZ}	Tristate Leakage Current	—	±20	uA	0.55 < V _{OUT} < V _{CC}

AC Timing Specifications

AC timing specifications provided are based on external zero-pf capacitance load. Min/max cases are based on the following table:

Table 24. AC Timing Min / Max Conditions

Parameter	Min	Max	Unit
5.0V Power	4.75	5.25	Volts
3.3V Power (I/O Pads, VCCQ for 2x transfer mode)	3.135	3.465	Volts
2.5V Power (Internal Logic)	2.375	2.625	Volts
1.5V Power (VCCQ for 4x transfer mode)	1.425	1.575	Volts
Case Temperature	0	85	°C
