| 1       | DOCUMENT INFO   | 6  |
| 1.1     | Revision History  | 6  |
| 2       | FEATURES  | 6  |
| 2.1     | Video Acquisition   | 6  |
| 2.2     | Combfilter Video Decoder  | 6  |
| 2.3     | Video Scaler  | 7  |
| 2.4     | VBI Data Slicer   | 7  |
| 2.5     | Clock Generation  | 8  |
| 2.6     | General Features  | 8  |
| 2.7     | Summary SAA7114 versus SAA7115  | 9  |
| 3       | GENERAL DESCRIPTION   | 10 |
| 4       | QUICK REFERENCE DATA  | 11 |
| 5       | ORDERING INFORMATION  | 11 |
| 6       | BLOCK DIAGRAM   | 12 |
| 7       | PINNING   | 13 |
| 7.1     | Pinning List and Pinning Diagram  | 13 |
| 7.2     | Pin Configurations  | 19 |
| 7.3     | SAA7115 Pin Strapping   | 20 |
| 8       | FUNCTIONAL DESCRIPTION  | 21 |
| 8.1     | Decoder   | 21 |
| 8.1.1   | Analog input processing   | 21 |
| 8.1.1.1 | Clamping  | 23 |
| 8.1.1.2 | Gain control  | 23 |
| 8.1.2   | Chrominance and luminance processing  | 28 |
| 8.1.2.1 | Chrominance path  | 28 |
| 8.1.2.2 | Luminance path  | 32 |
| 8.1.2.3 | Brightness Contrast Saturation (BCS) control and decoder output levels                        | 38 |
| 8.1.3   | Synchronization   | 39 |
| 8.1.4   | Clock generation circuit  | 39 |
| 8.1.5   | Power-on reset and Chip Enable (CE) input   | 41 |
| 8.2     | Output Formatter  | 43 |
| 8.3     | Scaler  | 49 |
| 8.3.1   | Acquisition control and task handling (subaddresses 80H, 90H, 91H, 94H to 9FH and C4H to CFH) | 50 |
| 8.3.1.1 | Input field processing  | 50 |
| 8.3.1.2 | Task handling   | 51 |
| 8.3.1.3 | Output field processing   | 52 |
| 8.3.2   | Horizontal scaling  | 55 |
| 8.3.2.1 | Horizontal prescaler (subaddresses A0H to A7H and D0H to D7H)                                 | 55 |
| 8.3.2.2 | Horizontal fine scaling (variable phase delay filter; subaddresses A8H to AFH and D8H to DFH) | 60 |
| 8.3.3   | Vertical scaling  | 60 |
| 8.3.3.1 | Line FIFO buffer (subaddresses 91H, B4H and C1H, E4H)   | 60 |
| 8.3.3.2 | Vertical scaler (subaddresses B0H to BFH and E0H to EFH)                                      | 61 |
| 8.3.3.3 | Use of the vertical phase offsets   | 61 |
| 8.4     | VBI-data decoder and capture (subaddresses 40H to 7FH)  | 65 |
| 8.4.1   | VBI Data Slicer   | 65 |
| 8.4.2   | I2C Readback of sliced VBI data   | 67 |

|         |  |     |
|---------|--|-----|
| 8.4.3   | Sliced VBI Data Output at the I-Port. . . . .  | 68  |
| 8.4.3.1 | Euro WST, US WST and NABTS Data . . . . .  | 68  |
| 8.4.3.2 | WSS 625 Data . . . . .   | 68  |
| 8.4.3.3 | WSS 525 Data . . . . .   | 68  |
| 8.4.3.4 | VPS Data . . . . .   | 68  |
| 8.4.3.5 | Closed Caption . . . . .   | 68  |
| 8.4.3.6 | Moji Data . . . . .  | 68  |
| 8.4.3.7 | VITC Data . . . . .  | 69  |
| 8.4.3.8 | Open Data Types. . . . .   | 69  |
| 8.5     | Image port output interface (subaddresses 84H to 87H) . . . . .                              | 70  |
| 8.5.1   | Scaler output formatter (subaddresses 93H and C3H) . . . . .                                 | 71  |
| 8.5.2   | Video FIFO (subaddress 86H) . . . . .  | 71  |
| 8.5.3   | Text FIFO . . . . .  | 72  |
| 8.5.4   | Video / text arbitration and Data packing (subaddress 86H) . . . . .                         | 72  |
| 8.5.4.1 | VBI insertion in SAV/EAV mode (bit SLDOM[3] = '1') . . . . .                                 | 72  |
| 8.5.4.2 | Data Packing (bit IMPAK (86H) and programming of the pulse generator via addr. F5H to FBH)73 |     |
| 8.5.5   | Data stream coding and reference signal generation (subaddresses 84H, 85H and 93H) . . . . . | 73  |
| 8.6     | Scaler Backend clock generation (subaddresses 30H to 3FH). . . . .                           | 79  |
| 8.6.1   | Square Pixel Clock Generation . . . . .  | 80  |
| 8.6.1.1 | The second PLL (PLL2). . . . .   | 80  |
| 8.7     | Audio clock generation (subaddresses 30H to 3FH). . . . .                                    | 82  |
| 8.7.1   | Audio clock generation without analog PLL (CGC2) enhancement . . . . .                       | 82  |
| 8.7.1.1 | Master audio clock. . . . .  | 82  |
| 8.7.1.2 | Signals ASCLK and ALRCLK . . . . .   | 83  |
| 8.7.2   | Audio clock generation with analog PLL (CGC2) support . . . . .                              | 84  |
| 8.7.3   | Other control signals for audio clock generation . . . . .                                   | 89  |
| 9       | INPUT/OUTPUT INTERFACES AND PORTS. . . . .   | 90  |
| 9.1     | Analog terminals . . . . .   | 90  |
| 9.2     | Audio clock signals . . . . .  | 90  |
| 9.3     | Clock and real-time synchronization signals. . . . .   | 91  |

## 1 DOCUMENT INFO

### 1.1 Revision History

| VERSION NO | REVISION DATE | DESCRIPTION OF STATUS  | BY            |
|------------|---------------|--|---------------|
| 0.5        | 5 Oct 2001    | Initial Version  | H. Lambers    |
| 0.51       | 9 Oct 2001    | Fixed LCBW recommended setting   | H. Lambers    |
| 0.52       | 9 Oct 2001    | VBSL setting changed, scaler and PLL2 examples , sect. 16.4 and 16.5 updated | A. Mittelberg |
| 0.6        | 10 Oct 2001   | Added application examples   | H. Lambers    |
| 0.65       | 18 Oct 2001   | Status at CQS  | H. Lambers    |
| 0.66       | 19 Oct 2001   | Minor updates  | H. Lambers    |
| 0.67       | 23 Oct 2001   | Fixed application example drawing  | H. Lambers    |

## 2 FEATURES

### 2.1 Video Acquisition

- Six analog inputs, internal analog source selectors, (e.g.: 6x CVBS or(2 x YC and 2 CVBS) or (1 x YC and 4xCVBS)
- Two built in analog anti-alias filters
- Two improved 9 Bit CMOS analog-to-digital converter in differential CMOS style at two-fold ITU-656 oversampling (27MHz)
- Fully programmable static gain or automatic gain control (AGC) for the selected CVBS or Y/C channel
- Automatic Clamp Control (ACC) for CVBS, Y and C
- Switchable white Peak Control · Two 9-bit Video CMOS AD Converters, digitized CVBS or Y/C
- signals are available on the expansion port (X-port)
- Requires only one crystal (32.11 MHz or 24.576 MHz) for all standards
- Independent Gain and Offset - adjustment for raw data path

### 2.2 Combfilter Video Decoder

- Digital PLL for Synchronization and Clock Generation from all Standards and Non Standard Video Sources e.g. consumer grade VTR
- Automatic detection of 50/60Hz field frequency, and automatic recognition of all common broadcast standards
- Enhanced Horizontal and vertical Sync Detection
- Luminance and chrominance signal processing for
  - PAL BGDHIN,
  - Combination-PAL N,
  - PAL M,
  - NTSC M,
  - NTSC-Japan,
  - NTSC 4.43 and
  - SECAM (50 Hz / 60 Hz)
- PAL delay line for correcting PAL phase errors

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

- Improved 2/4-line comb filter for two dimensional chrominance/luminance-separation operating with adaptive combfilter parameters.
  - Increased Luminance and Chrominance Bandwidth for all PAL and NTSC-standards
  - Reduced cross colour and cross luminance artefacts
- Independent Brightness Contrast Saturation (BCS) - adjustment for decoder-part
- User programmable sharpness control
- Detection of Copy protected input signals:
  - according to Macrovision standard
  - indicating the level of protection
- Automatic TV/VCR detection
- 10 bit wide video output at combfilter video decoder
- X-port video output either as:
  - Noise shaped 8 bit ITU-656 video or
  - Full 10 bit ITU-656 interface (DC-performance 9 Bit)

### 2.3 Video Scaler

- Horizontal and Vertical Down-Scaling and Up-Scaling to randomly sized windows
- Horizontal and Vertical Scaling range: variable zoom to 1/64 (icon) (Note: H and V zoom are restricted by the transfer data rates)
- Vertical Scaling with Linear Phase Interpolation and Accumulating Filter for Anti-Aliasing (6 bit phase accuracy)
- Conversion to Square Pixel format
- Generation of a video output stream with improved synchronisation grid at the I-Port
- Two independent programming sets for scaler part, to define two "ranges" per field or sequences over frames
- Fieldwise switching between Decoder-part and Expansion port (X-port) input
- Brightness, contrast and saturation controls for scaled outputs

### 2.4 VBI Data Slicer

- Versatile VBI-data decoder, slicer, clock regeneration and byte synchronization, e.g. for:
  - WST525 / WST625 (CCST)
  - VPS
  - US / European Close Caption (CC),
  - WSS525 (CGMS), WSS625,
  - US NABTS
  - VITC 525 / VITC 625
  - GEMSTAR 1x
  - GEMSTAR 2x
  - Moji
- I<sup>2</sup>C Readback of the following decoded data types:
  - US Close Caption (CC)
  - European Close Caption (CC)

## 2.5 Clock Generation

- On-Chip Line Locked Clock Generation according ITU601
- Generation of a frame locked Audio Master Clock to support a constant number of audio clocks per video field.
- Second onboard analog PLL to be used for:
  - On-Chip Line Locked Square Pixel Clock Generation for PAL and NTSC Square Pixel Video Output or
  - optionally Generation of a low jitter frame locked Audio Clock from the Audio Master Clock through reuse of the analog Square Pixel PLL. Supported audio clock frequencies are  $256 \cdot f_s$ ,  $384 \cdot f_s$  and  $512 \cdot f_s$  ( $f_s = 32 \text{ KHz}$ ,  $44.1 \text{ KHz}$  or  $48 \text{ KHz}$ ).

## 2.6 General Features

- CMOS 3.3 V device with 5 V tolerant digital inputs and I/O ports
- Programming via serial I<sup>2</sup>C-bus, full read-back ability by an external controller, bit rate up to 400 kbit/s
- Software controlled power saving stand-by modes
- Boundary Scan Test circuit complies to the IEEE Std. 1149.b1 -1994

## 2.7 Summary SAA7114 versus SAA7115

**Table 1** SAA7114 versus SAA7115

| ISSUE                       | SAA7114   | SAA7115  |
|-----------------------------|---|--|
| Pin compatibility           | reference pinning   | pin-compatible to SAA7114  |
| Analog Frontend             | 2 x 9 bit A/D- converters   | 2 x Low Noise 9 bit A/D- converters  |
|                             | 13.5 MHz CCIR sampling  | 27 MHz CCIR 2x-oversampling  |
|                             | Standard White-Peak Control watching raw data                             | Standard White-Peak Control watching raw data plus baseband luminance data   |
| Combfiler Decoder           | 4 lines adaptive comb filter  | Improved 4 lines adaptive comb filter (reduced artifacts)  |
|                             | Manual TV/VCR switching   | Automatic TV/VCR detection   |
|                             | Semi-automatic color standard detection                                   | Fully-automatic color standard detection   |
|                             | Regular SECAM 50 Hz   | Regular SECAM 50 Hz and SECAM 60 Hz (Vietnam)  |
|                             | Color overflow detection  | Automatic color reducer (avoids color limitation with low burst)   |
|                             | Safe lock for VCR feature modes   | Extended safe lock for VCR feature modes   |
|                             | Fast frame lock (ca. 2 fields)  | Ultra-fast frame lock (almost 1 field)   |
| Macrovision Detection       | 'Pseudo Sync.' Macrovision Detection only                                 | Comprehensive Macrovision Detection:<br>- 'Pseudo Sync.' detection and/or<br>- Split Burst detection (Type 2 / Type 3)   |
| Scaled Video Output         | Generation of embedded ITU-656 auxiliary codes at the I-Port video output | Generation of embedded ITU-656 auxiliary codes at the I-Port video output with improved synchronization raster for VCR signals   |
| Clock Generation            | Scaling to Square Pixel Data representation                               | Scaling to Square Pixel Data representation with extra integrated clock-PLL (PLL2, CGC2) to generate physical Square Pixel Clock signal of 29.5 MHz (PAL) or 24.5454 MHz (NTSC). |
|                             | Field- locked audio clock (constant number of clock cycles per field)     | Frame- locked audio clock (constant number of clock cycles per frame), optionally through analog PLL (CGC2)  |
| VBI Data Slicing and Output | Versatile VBI- data slicer  | Versatile VBI- data slicer, incl. CGMS (Line 20 NTSC) and GemStar 2x (EPG)   |
|                             | Output of sliced data embedded into I-Port output stream                  | Output of sliced data embedded into I-Port output stream and optionally per I2C register readback for CC, CGMS, Gemstar1x and Gemstar2x,   |
|                             |   |  |

|                        |                      |          |          |

### 3 GENERAL DESCRIPTION

The SAA7115 is a video capture device for various applications ranging from small screen products like e.g. digital settop boxes, personal video recording applications to big screen devices like e.g. LCD projectors due to its improved combfilter performance and 10 bit video output capabilities.

The SAA7115 is a combination of a two channel analog preprocessing circuit including Source-Selection, Anti-Aliasing Filter and A/D-converter, an Automatic Clamp and Gain Control, two Clock Generation Circuits (CGC1, CGC2), a Digital Multi Standard Decoder containing two-dimensional chrominance/luminance separation by an improved adaptive comb filter and a high performance scaler, including variable horizontal and vertical up and down scaling and a Brightness-Contrast- Saturation- Control circuit.

The decoder is based on the principle of line-locked clock decoding and is able to decode the colour of PAL, SECAM and NTSC signals into ITU-601 compatible colour component values. The SAA7115 accepts as analog inputs CVBS or S-Video (Y-C) from TV or VCR sources, including weak and distorted signals.

The expansion port (X-port) for digital video (bi-directional half duplex, D1 compatible) can be used either to output unscaled video using 10 bit or 8 bit dithered resolution or to connect to other external digital video sources for reuse of the SAA7115 scaler features.

The enhanced image port (I-port) of the 7115 supports 8 (16) bit wide output data with auxiliary reference data for interfacing to e.g. VGA controllers, settop box applications etc. It is also possible to output video in Square Pixel formats accompanied by a square pixel clock of the appropriate frequency.

In parallel SAA7115 incorporates also provisions for capturing the serially coded data in the vertical blanking interval (VBI-data) of several standards. Three basic options are available to transfer the VBI data to other devices:

- capturing raw video samples, after interpolation to the required output data rate, using the scaler and transferring the data to a device connected to the I-port,
- slicing the VBI data using the build in VBI data slicer (data recovery unit) and transferring the data to a device connected to the I-port
- slicing the VBI data using the build in VBI data slicer and reading out the sliced data via the I<sup>2</sup>C bus (for several slow VBI data type standards only)

SAA7115 incorporates also a frame locked audio clock generation. This function ensures that there is always the same number of audio samples associated with a frame, or a set of fields. This prevents the loss of synchronisation between video and audio, during capture or playback. Furthermore the second analog onboard PLL optionally can be used to enhance this audio clock to a low jitter frame locked audio clock.

The SAA7115 is controlled via I<sup>2</sup>C-bus (full write / read capability for all programming registers, bit rate up to 400 kbits/s)

## 7 PINNING

### 7.1 Pinning List and Pinning Diagram

**Table 2** Pinning List SAA7115

| SYMBOL            | PIN | I/O/P | DESCRIPTION   |
|-------------------|-----|-------|---|
| V <sub>DDE</sub>  | 1   | P     | digital supply voltage 3.3 V (external pad supply)  |
| TDO               | 2   | O     | Test Data Output for Boundary Scan Test <sup>(2)</sup>  |
| TDI               | 3   | I     | Test Data Input for Boundary Scan Test (with internal pull-up) <sup>(2)</sup>   |
| XTOUT             | 4   | O     | crystal oscillator output signal, auxiliary signal  |
| V <sub>XSS</sub>  | 5   | P     | ground pin for crystal oscillator   |
| XTALO             | 6   | O     | 24.576 (32.11) MHz crystal oscillator output; not connected if XTALI is driven by an external single-ended oscillator.                      |
| XTALI             | 7   | I     | Input terminal for 24.576 (32.11) MHz crystal oscillator or connection of external oscillator with TTL compatible square wave clock signal. |
| V <sub>XDD</sub>  | 8   | P     | supply voltage pin of crystal oscillator  |
| V <sub>SSA2</sub> | 9   | P     | ground for analog inputs AI2x   |
| AI24              | 10  | I     | analog input 24   |
| V <sub>DDA2</sub> | 11  | P     | analog supply voltage for analog inputs AI2x (3.3V)   |
| AI23              | 12  | I     | analog input 23   |
| AI2D              | 13  | I     | differential input for ADC channel 2 (pins AI24, AI23, AI22, AI21)  |
| AI22              | 14  | I     | analog input 22   |
| V <sub>SSA1</sub> | 15  | P     | ground for analog inputs AI1x   |
| AI21              | 16  | I     | analog input 21   |
| V <sub>DDA1</sub> | 17  | P     | analog supply voltage for analog inputs AI1x (3.3V)   |
| AI12              | 18  | I     | analog input 12   |
| AI1D              | 19  | I     | differential input for ADC channel 1 (pins AI12, AI11)  |
| AI11              | 20  | I     | analog input 11   |
| AGND              | 21  | P     | analog ground connection  |
| AOUT              | 22  | O     | Analog test output (do not connect)   |
| V <sub>DDA0</sub> | 23  | P     | analog positive supply voltage for both internal CGC (Clock Generation Circuit) (3.3V)  |
| V <sub>SSA0</sub> | 24  | P     | analog ground for internal CGC  |

| SYMBOL           | PIN | I/O/P  | DESCRIPTION  |
|------------------|-----|--------|--|
| V <sub>DDE</sub> | 25  | P      | digital supply voltage 3.3 V (external pad supply)   |
| V <sub>SSE</sub> | 26  | P      | digital ground (external pad supply)   |
| CE               | 27  | I      | Chip Enable or RESET input (with internal pull up)   |
| LLC              | 28  | O      | line-locked system clock output (27 MHz nominal), for backward compatibility, do not use for new applications  |
| LLC2             | 29  | O      | line locked clock/2 output (13.5 MHz nominal) for backward compatibility, do not use for new applications  |
| RESON            | 30  | O      | RESet Output Not signal  |
| SCL              | 31  | I (/O) | IIC serial clock line (with inactive output path)  |
| SDA              | 32  | I/O    | IIC serial data line   |
| V <sub>DDI</sub> | 33  | P      | digital supply voltage 3.3 V internal core supply)   |
| RTS0             | 34  | O      | real time status or sync information, controlled by subaddr. "11h and 12h"   |
| RTS1             | 35  | O      | real time status or sync information, controlled by subaddr. "11h and 12h"   |
| RTCO             | 36  | (I) O  | Real Time Control Output: contains information about actual system clock frequency, field rate, odd/even sequence, decoder status, subcarrier phase and frequency and PAL sequence (according to RTC level 3.1, refer to external document "RTC Functional Specification" for details), can be strapped to supply via a 3.3 kOhm resistor to change the default IIC-wr-addresses from 42/43 (internal pull down) to 40/41. |
| AMCLK            | 37  | O      | audio master clock output  |
| V <sub>SSI</sub> | 38  | P      | digital ground (internal core supply)  |
| ASCLK            | 39  | O      | audio serial clock output  |
| ALRCLK           | 40  | (I) O  | audio left/right clock output,<br>Can be strapped to supply via a 3.3 kOhm resistor indicate that the default 24.576 MHz crystal (internal pull down) has been replaced by a 32.11 MHz crystal.  |
| AMXCLK           | 41  | I      | audio master external clock input (typing error corrected)   |
| ITRDY            | 42  | I      | target ready input, image port (with internal pull up)   |
| V <sub>DDI</sub> | 43  | P      | digital supply voltage 3.3 V (internal core supply)  |
| TEST0            | 44  | O      | do not connect, reserved for future extensions and for <b>Testing</b> : scan output  |
| ICLK             | 45  | I/O    | clock output signal for image-port, LCLK of LPB image port mode, or optional asynchron. backend clock input  |
| IDQ              | 46  | O      | output data qualifier for image port ( <i>optional: gated clock output</i> )   |

| SYMBOL           | PIN | I/O/P  | DESCRIPTION   |
|------------------|-----|--------|---|
| ITRI             | 47  | I (/O) | image-port output control signal, effects all I-port pins incl. ICLK, enable and active polarity is under software control (bits IPE in subaddr. "87")<br>output path used for <b>Testing</b> : scan output |

**Notes**

1. This pin provides easy initialization of BST circuitry. TRSTN can be used to force the TAP (Test Access Port) controller to the Test-Logic-Reset state (normal operation) at once
2. According to the IEEE1149.b1-1994 standard the pads TDI and TMS are input pads with a internal pull-up transistor and TDO a tri-state output pad. TCK, TRSTN are also build with internal pull\_up

## 7.2 Pin Configurations

**Table 3** Pin Configurations

| pin no                  | pin name | 8 bit input modes    | 16 bit input modes | alternative input functions | 8 bit output modes                       | 16 bit output modes | alternative output functions | I/O configuration prog. bits   |

### 7.3 SAA7115 Pin Strapping

**Table 4** SAA7115 Pin Strapping

| pin no | pin name | function  |
|--------|----------|---|
| 36     | RTCO     | operates as IICSA pin, "0" = SA 42/43 hex (default), "1" = SA 40/41 hex |
| 40     | ALRCLK   | 0 = 24.576 MHz crystal (default)<br>1 = 32.110 MHz crystal              |

#### Note

- Pin strapping is done by connecting the pin to supply via a 4.7 kOhm resistor. During the power up reset sequence the corresponding pins are switched to input-mode to read the strapping level. For the default setting no strapping resistor is necessary (internal pull down)

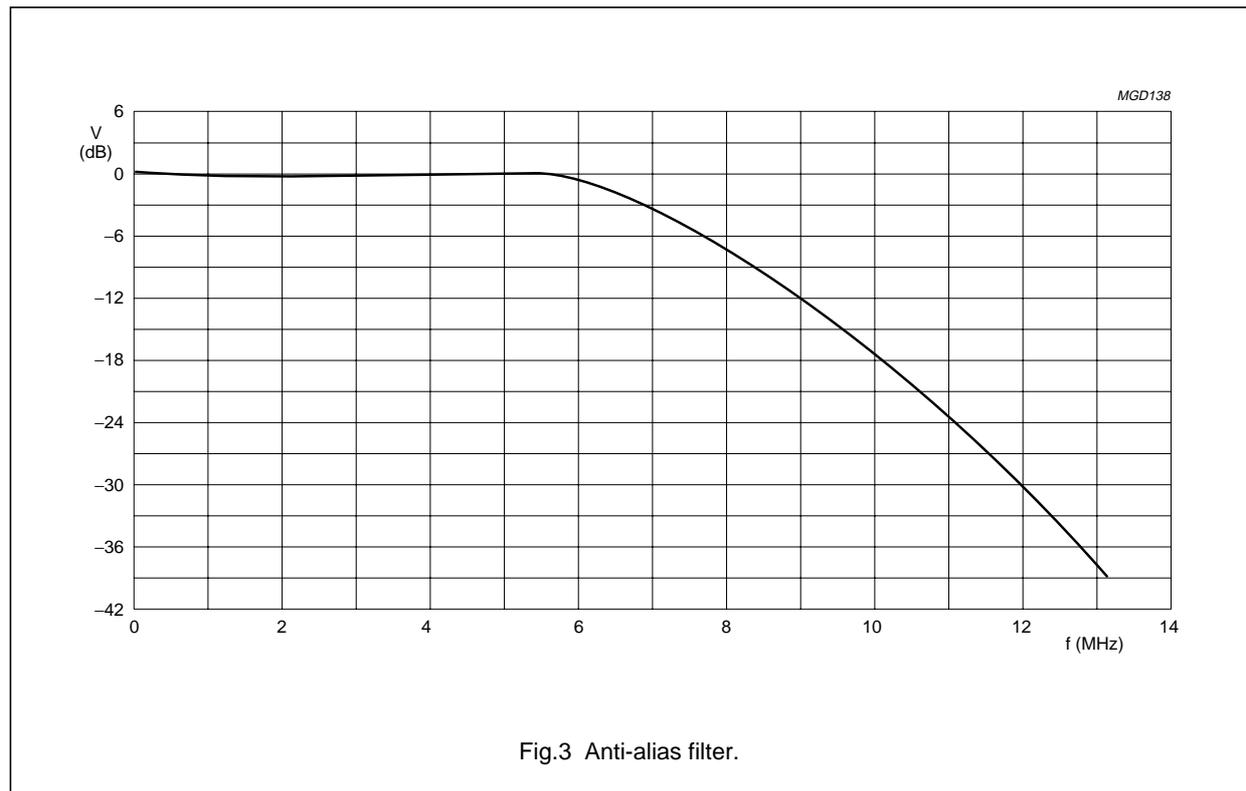

## 8 FUNCTIONAL DESCRIPTION

### 8.1 Decoder

#### 8.1.1 ANALOG INPUT PROCESSING

The SAA7115 offers six analog signal inputs, two analog main channels with source switch, clamp circuit, analog amplifier, anti-alias filter and video 9-bit CMOS ADC with a Decimation Filter (DF); see Figs 4 and 7.

The anti-alias filters are adapted to the line-locked clock frequency via a filter control circuit. The characteristic is shown in Fig.3. During the vertical blanking period gain and clamping control are frozen.

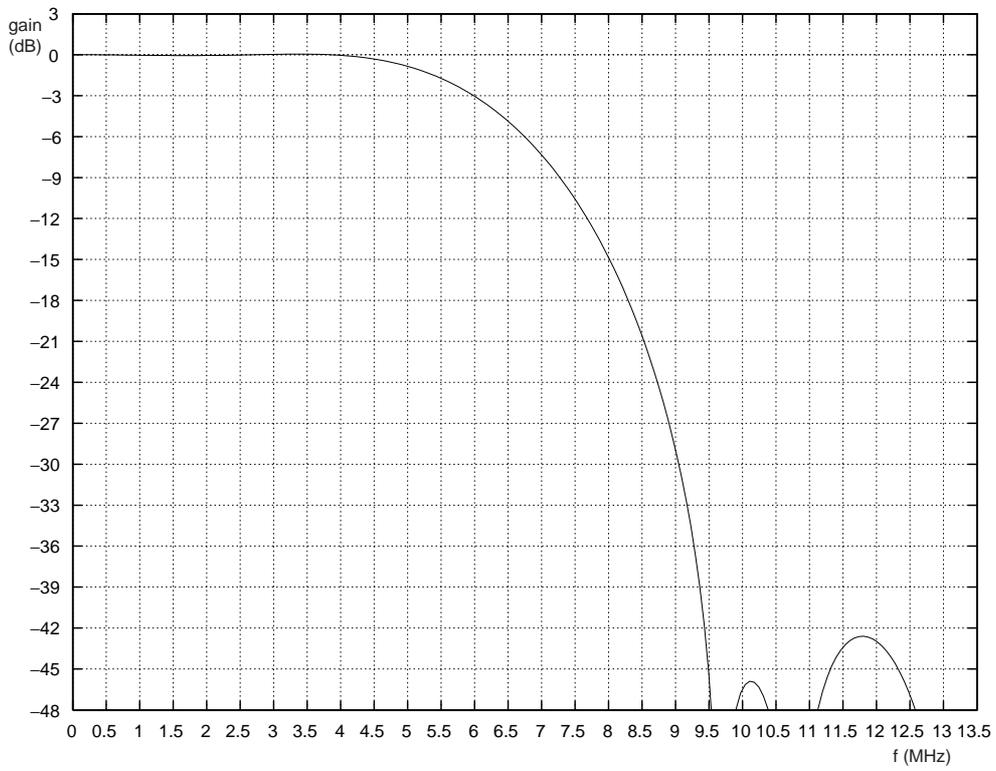

Fig.4 Decimation filter.

### 8.1.1.1 Clamping

The clamp control circuit controls the correct clamping of the analog input signals. The coupling capacitor is also used to store and filter the clamping voltage. An internal digital clamp comparator generates the information with respect to clamp-up or clamp-down. The clamping levels for the two ADC channels are fixed for luminance (120), chrominance (256) and for component inputs as component Y (32), components  $P_B$  and  $P_R$  (256). The clamping time is defined by the internally generated HCL pulse on the back porch of the video signal.

### 8.1.1.2 Gain control

The gain control circuit receives (via the I<sup>2</sup>C-bus) the static gain levels for the two analog amplifiers or controls one of these amplifiers automatically via a built-in Automatic Gain Control (AGC) as part of the Analog Input Control (AICO).

The AGC (automatic gain control for luminance) is used to amplify a CVBS or Y signal to the required signal amplitude, matched to the ADCs input voltage range. The AGC active time is the sync bottom of the video signal and is defined by the internally generated HSY pulse.

Signal (white) peak control limits the gain at signal overshoots. The flow charts (see Figs 8 and 9) show more details of the AGC. The influence of supply voltage variation within the specified range is automatically eliminated by clamp and automatic gain control.

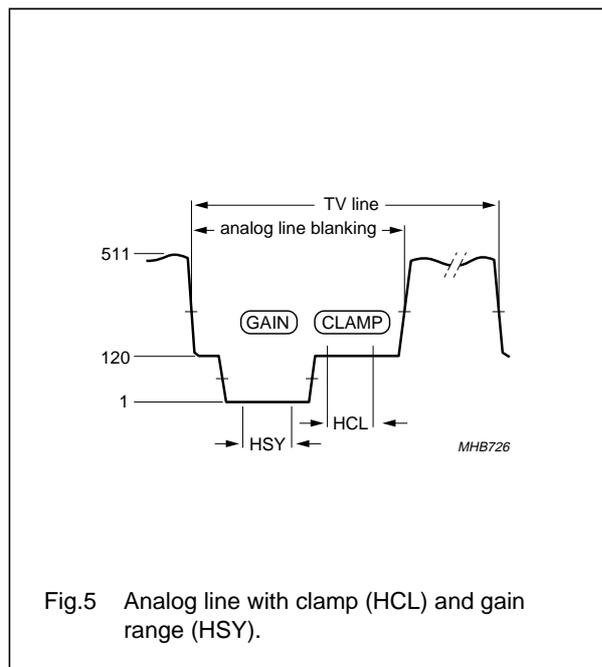

Fig.5 Analog line with clamp (HCL) and gain range (HSY).

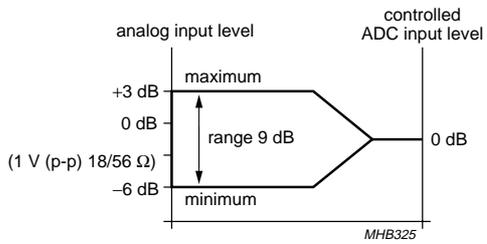

Fig.6 Automatic gain range.

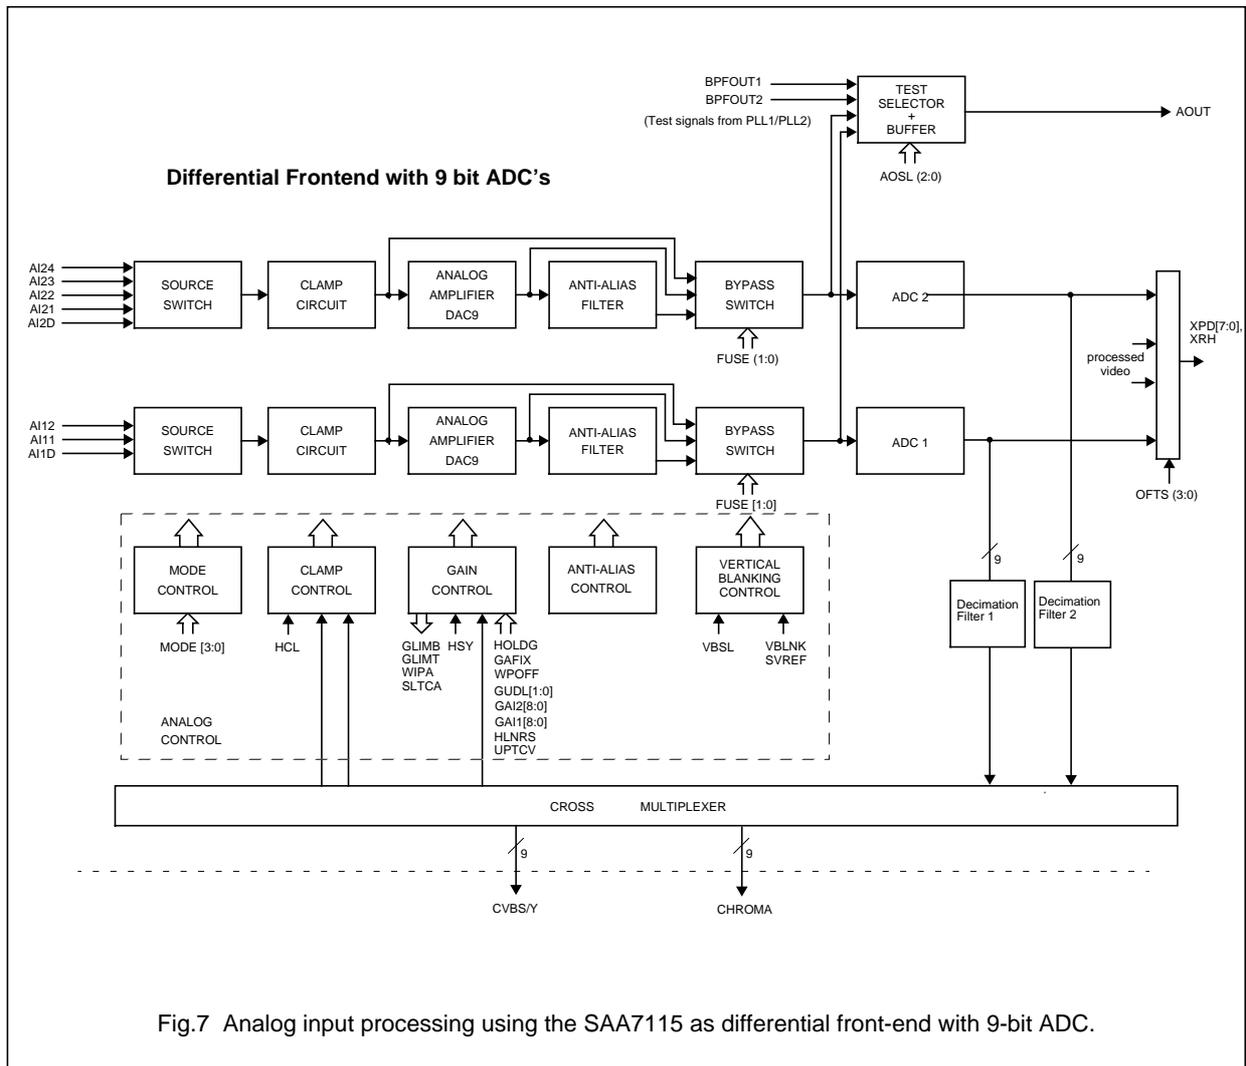

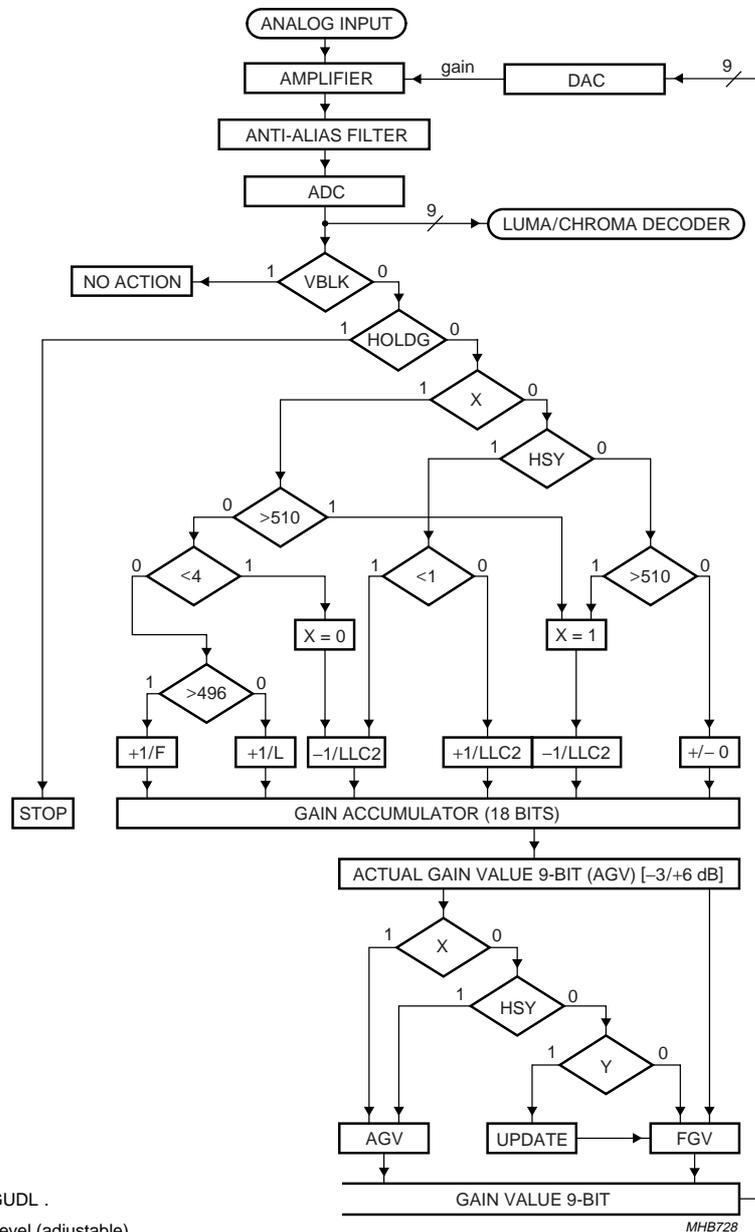

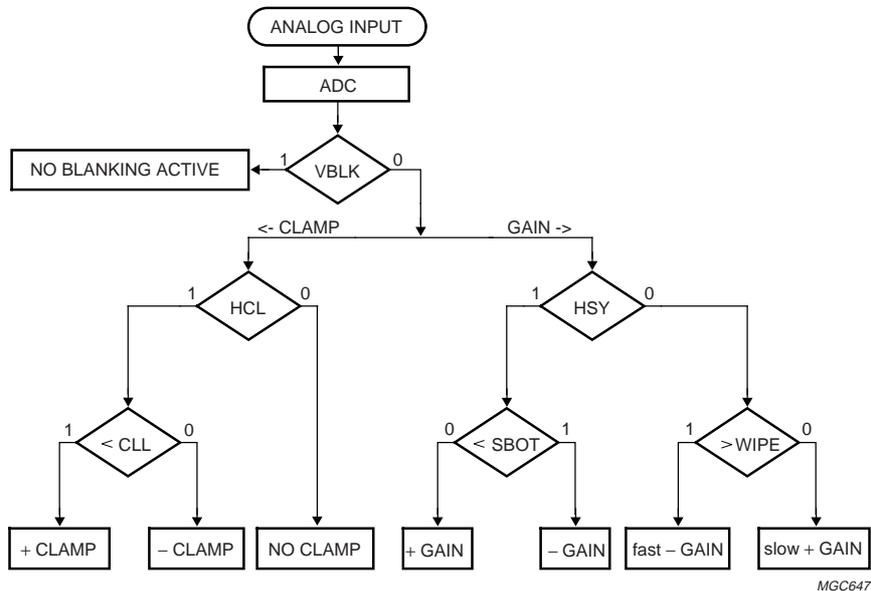

Fig.7 Analog input processing using the SAA7115 as differential front-end with 9-bit ADC.

X = system variable.  
 Y =  $|AGV - FGV| > GUDL$  .  
 GUDL = gain update level (adjustable).  
 VBLK = vertical blanking pulse.  
 HSY = horizontal sync pulse.  
 AGV = actual gain value.  
 FGV = frozen gain value.

MHB728

Fig.8 Gain flow chart.

WIPE = white peak level (510).  
 SBOT = sync bottom level (1).  
 CLL = clamp level [120 for CVBS, Y(C), S; 256 for C(Y), P<sub>B</sub>-P<sub>R</sub>; 32 for RGB, Y].  
 HSY = horizontal sync pulse.  
 HCL = horizontal clamp pulse.

Fig.9 Clamp and gain flow chart.

8.1.2 CHROMINANCE AND LUMINANCE PROCESSING

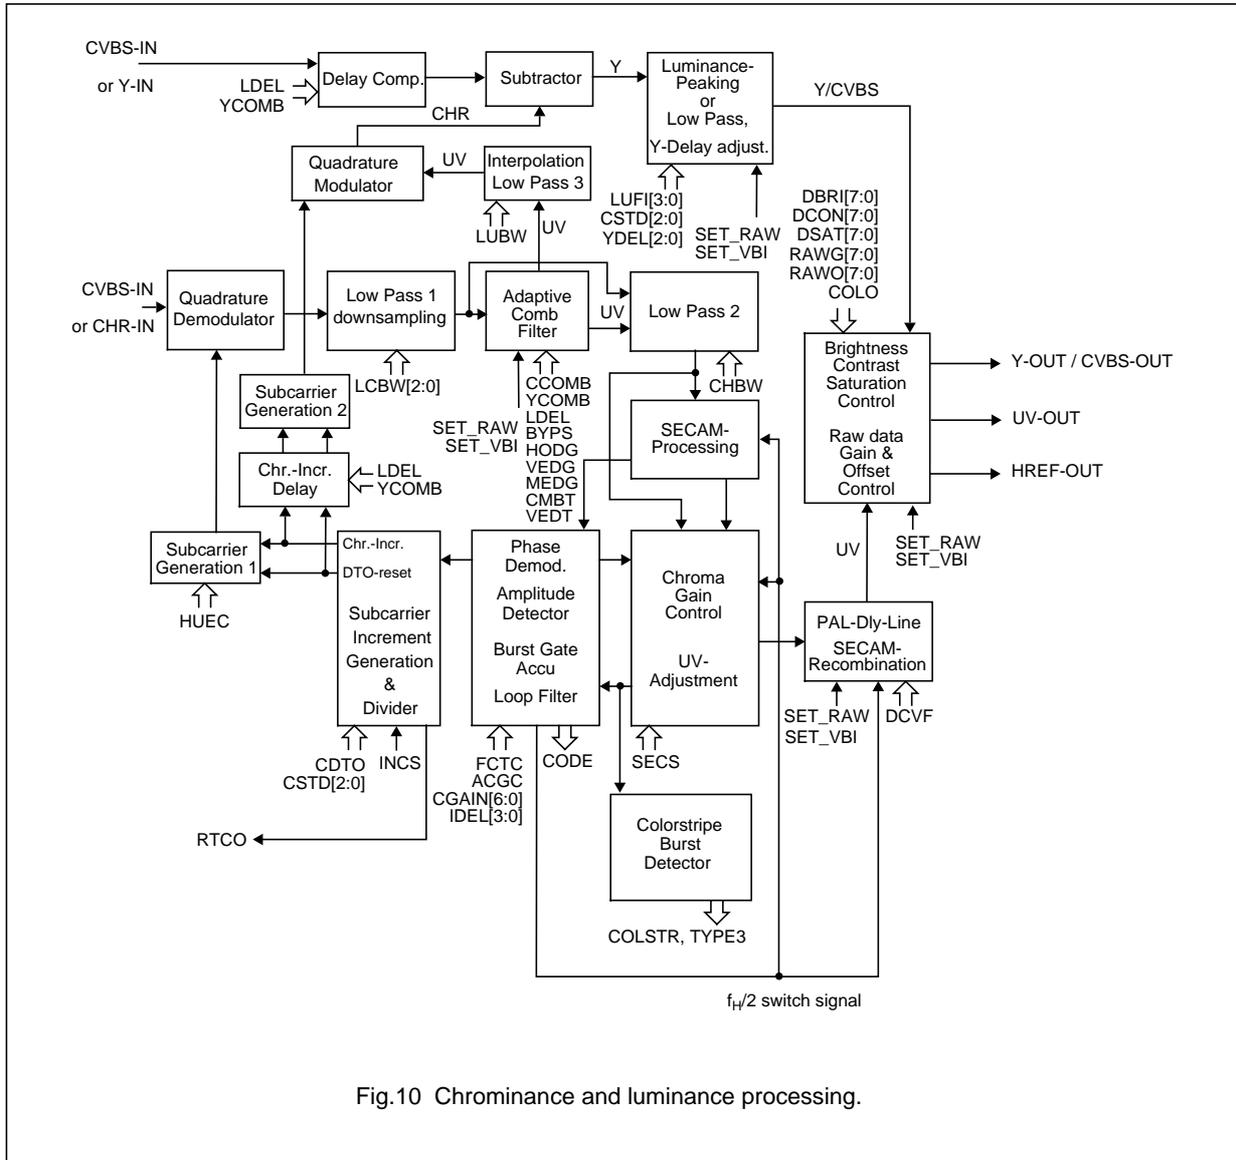

Fig.10 Chrominance and luminance processing.

8.1.2.1 Chrominance path

The 9-bit CVBS or chrominance input signal is fed to the input of a quadrature demodulator, where it is multiplied by two time-multiplexed subcarrier signals from the subcarrier generation block 1 (0° and 90° phase relationship to the demodulator axis). The frequency is dependent on the chosen colour standard.

The time-multiplexed output signals of the multipliers are low-pass filtered (low-pass 1). Eight characteristics are programmable via LCWB3 to LCWB0 to achieve the desired bandwidth for the colour difference signals (PAL, NTSC) or the 0° and 90° FM signals (SECAM).

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

The chrominance low-pass 1 characteristic also influences the grade of cross-luminance reduction during horizontal colour transients (large chrominance bandwidth means strong suppression of cross-luminance). If the Y-comb filter is disabled by YCOMB = 0 the filter influences directly the width of the chrominance notch within the luminance path (a large chrominance bandwidth means wide chrominance notch resulting in a lower luminance bandwidth).

The low-pass filtered signals are fed to the adaptive comb filter block. The chrominance components are separated from the luminance via a two line vertical stage (four lines for PAL standards) and a decision logic and mixing stage between the filtered and the non-filtered output signals. The decision logic can be fine adjusted by the control signals HODG, VEDG, MEDG, VEDT and CMBT. This block is bypassed for SECAM signals. The comb filter logic can be enabled independently for the succeeding luminance and chrominance processing by YCOMB (subaddress 09H, bit 6) and/or CCOMB (subaddress 0EH, bit 0). It is always bypassed during VBI or raw data lines programmable by the LCRn registers (subaddresses 41H to 57H); see Section 8.4.

The separated  $C_B$ - $C_R$  components are further processed by a second filter stage (low-pass 2) to modify the chrominance bandwidth without influencing the luminance path. It's characteristic is controlled by CHBW (subaddress 10H, bit 3). For the complete transfer characteristic of low-passes 1 and 2 see Figs 11 and 12.

The SECAM processing (bypassed for QAM standards) contains the following blocks:

- Baseband 'bell' filters to reconstruct the amplitude and phase equalized 0° and 90° FM signals
- Phase demodulator and differentiator (FM-demodulation)
- De-emphasis filter to compensate the pre-emphasized input signal, including frequency offset compensation (DB or DR white carrier values are subtracted from the signal, controlled by the SECAM switch signal).

The succeeding chrominance gain control block amplifies or attenuates the  $C_B$ - $C_R$  signal according to the required ITU 601/656 levels. It is controlled by the output signal from the amplitude detection circuit within the burst processing block.

The burst processing block provides the feedback loop of the chrominance PLL and contains the following:

- Burst gate accumulator
- Colour identification and colour killer
- Comparison nominal/actual burst amplitude (PAL/NTSC standards only)
- Loop filter chrominance gain control (PAL/NTSC standards only)
- Loop filter chrominance PLL (only active for PAL/NTSC standards)
- PAL/SECAM sequence detection, H/2-switch generation.

The increment generation circuit produces the Discrete Time Oscillator (DTO) increment for both subcarrier generation blocks. It contains a division by the increment of the line-locked clock generator to create a stable phase-locked sine signal under all conditions (e.g. for non-standard signals).

The PAL delay line block eliminates crosstalk between the chrominance channels in accordance with the PAL standard requirements. For NTSC colour standards the delay line can be used as an additional vertical filter. If desired, it can be switched off by DCVF = 1. It is always disabled during VBI or raw data lines programmable by the LCRn registers (subaddresses 41H to 57H); see Section 8.4. The embedded line delay is also used for SECAM recombination (cross-over switches).

The colorstripe burst detector detects partly or fully phase inverted burst according to the Macrovision standard. The protection level is reported by the status flags COLSTR and TYPE3.

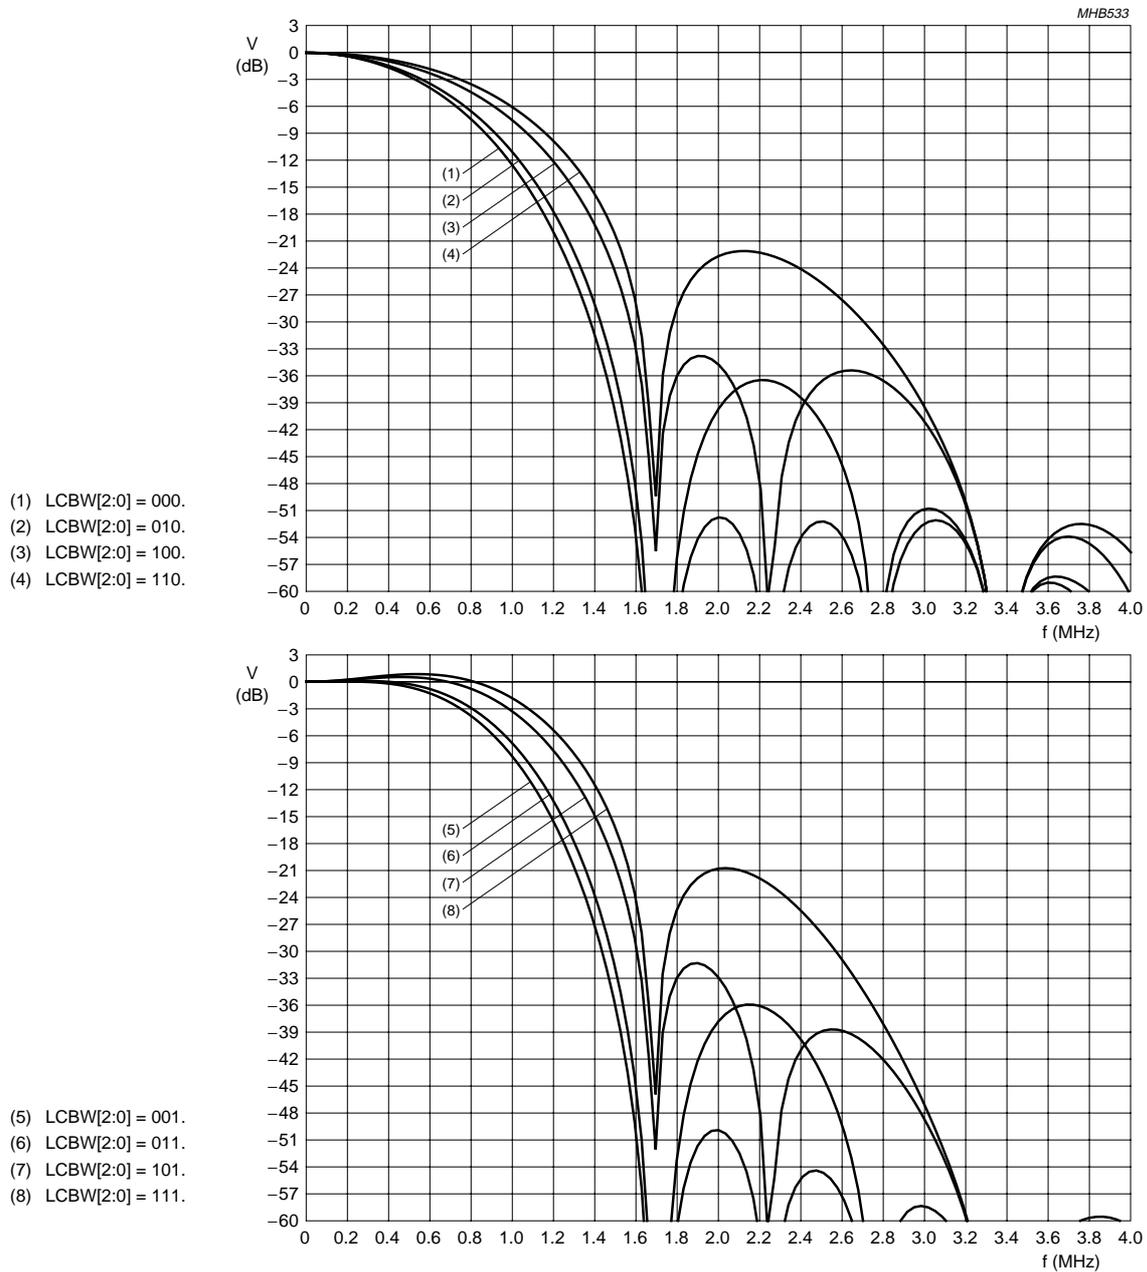

Fig.11 Transfer characteristics of the chrominance low-pass at CHBW = 0.

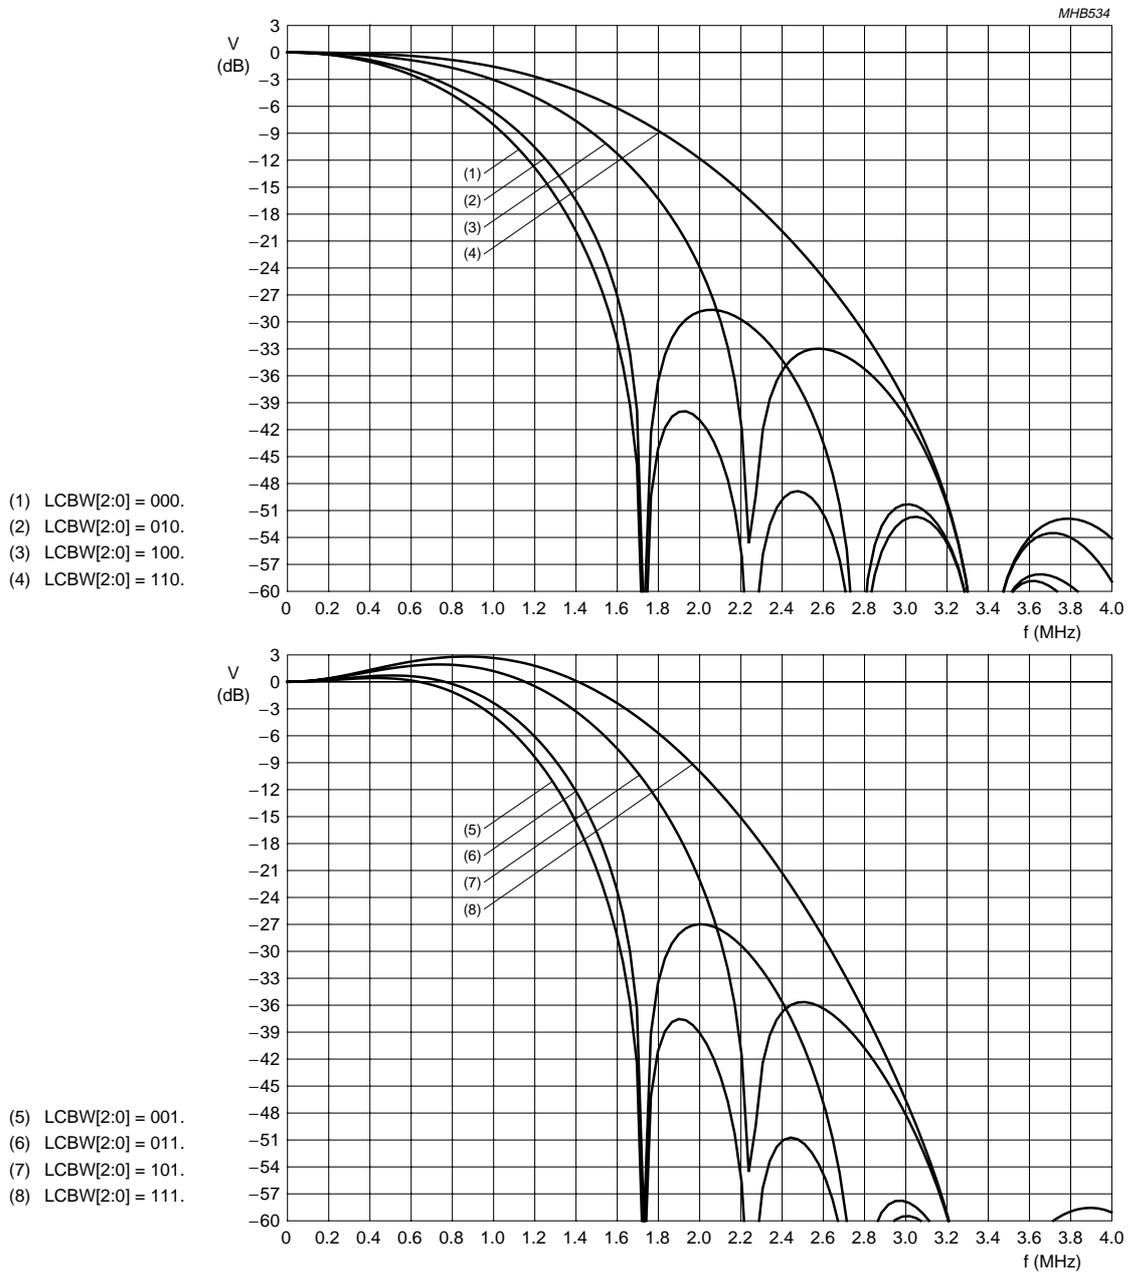

Fig.12 Transfer characteristics of the chrominance low-pass at CHBW = 1.

| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

### 8.1.2.2 Luminance path

The rejection of the chrominance components within the 9-bit CVBS or Y input signal is achieved by subtracting the remodulated chrominance signal from the CVBS input.

The comb filtered  $C_B$ - $C_R$  components are interpolated (upsampled) by the low-pass 3 block. Its characteristic is controlled by LUBW (subaddress 09H, bit 4) to modify the width of the chrominance 'notch' without influencing the chrominance path. The programmable frequency characteristics available, in conjunction with the LCBW2 to LCBW0 settings, can be seen in Figs 13 to 16. It should be noted that these frequency curves are only valid for Y-comb disabled filter mode (YCOMB = 0). In comb filter mode the frequency response is flat. The centre frequency of the notch is automatically adapted to the chosen colour standard.

The interpolated  $C_B$ - $C_R$  samples are multiplied by two time-multiplexed subcarrier signals from the subcarrier generation block 2. This second DTO is locked to the first subcarrier generator by an increment delay circuit matched to the processing delay, which is different for PAL and NTSC standards according to the chosen comb filter algorithm. The two modulated signals are finally added to build the remodulated chrominance signal.

The frequency characteristic of the separated luminance signal can be further modified by the succeeding luminance filter block. It can be configured as peaking (resolution enhancement) or low-pass block by LUF13 to LUF10 (subaddress 09H, bits 3 to 0). The 16 resulting frequency characteristics can be seen in Fig.17. The LUF13 to LUF10 settings can be used as a user programmable sharpness control.

The luminance filter block also contains the adjustable Y-delay part; programmable by YDEL2 to YDEL0 (subaddress 11H, bits 2 to 0).

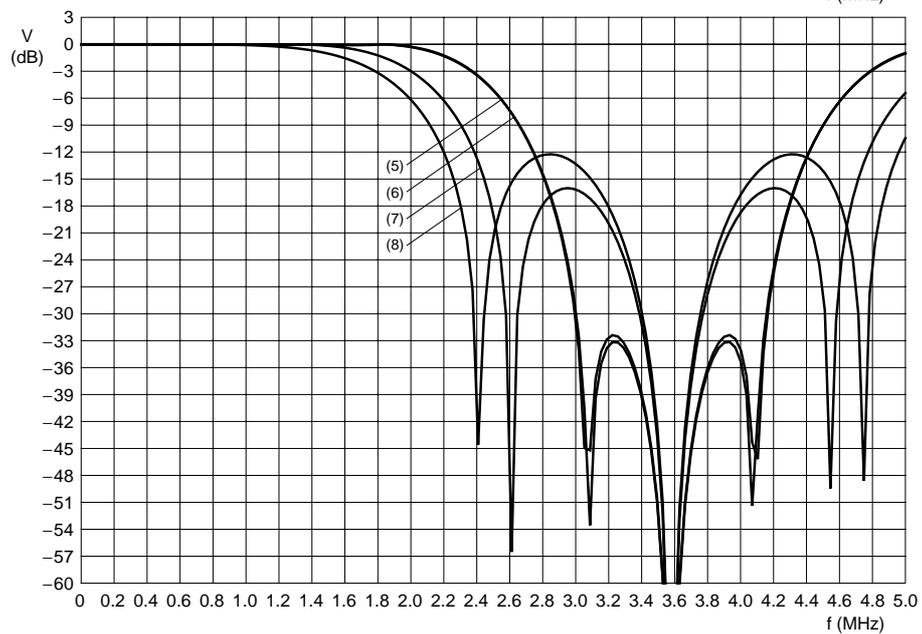

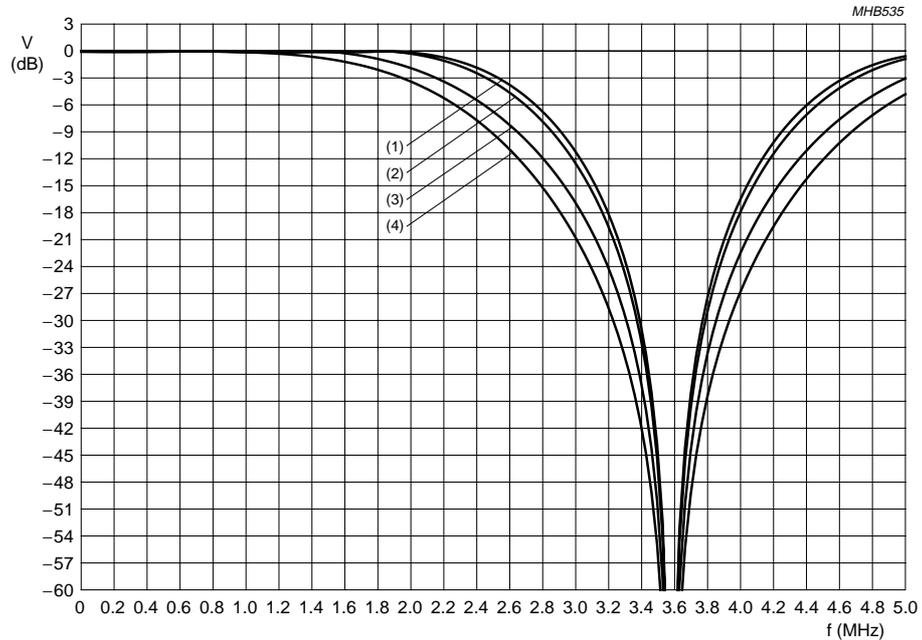

Fig.13 Transfer characteristics of the luminance notch filter in 3.58 MHz mode (Y-comb filter disabled) at LUBW = 0.

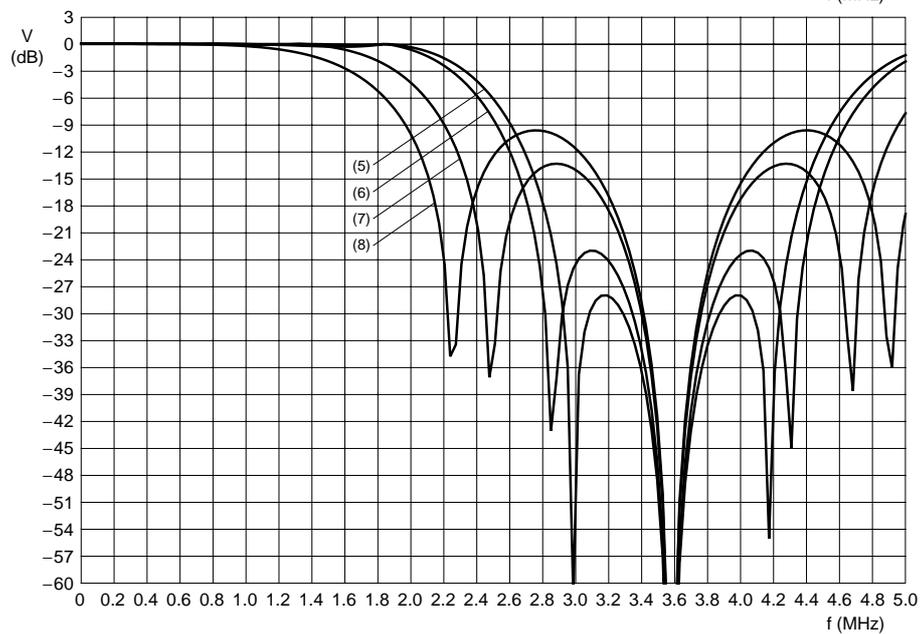

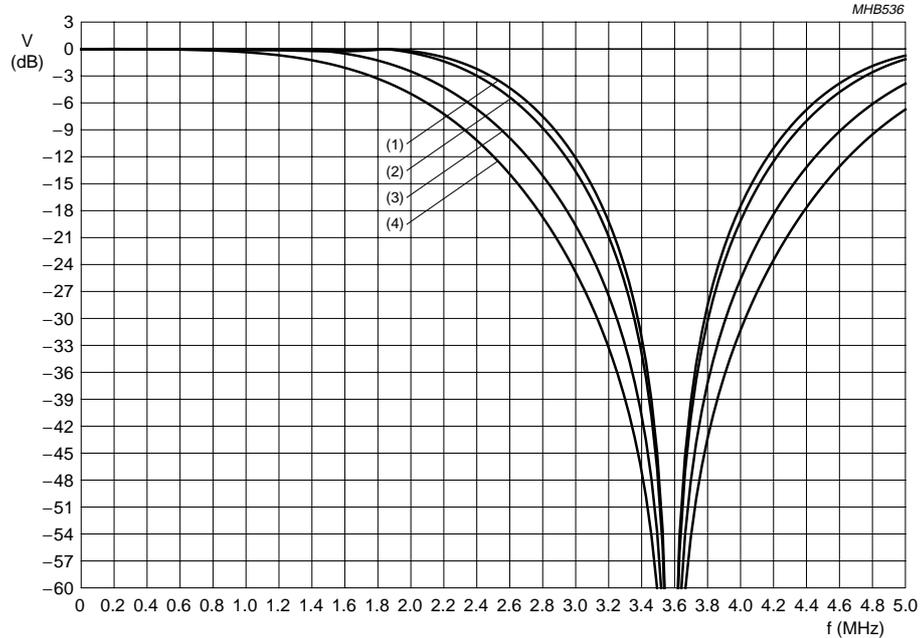

Fig.14 Transfer characteristics of the luminance notch filter in 3.58 MHz mode (Y-comb filter disabled) at LUBW = 1.

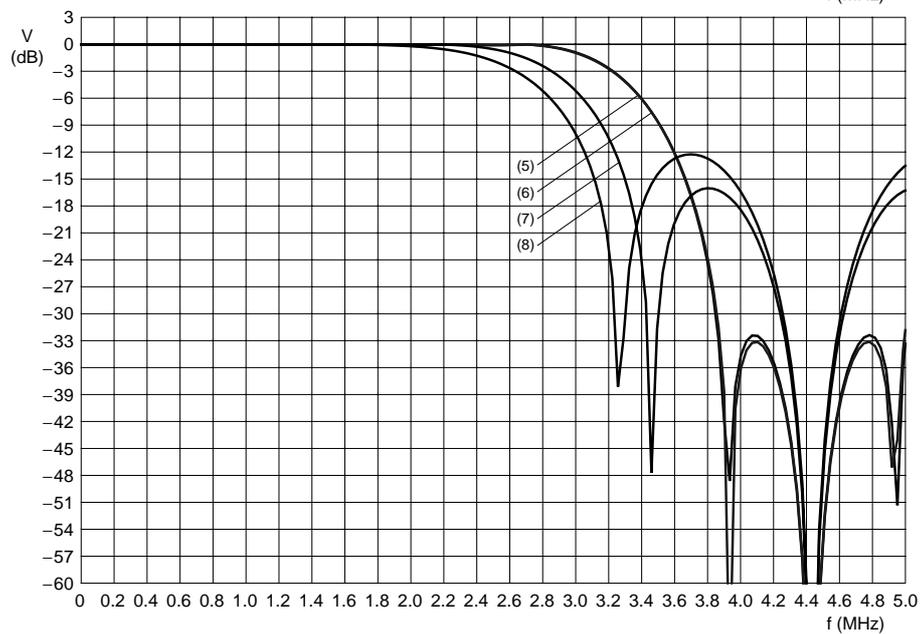

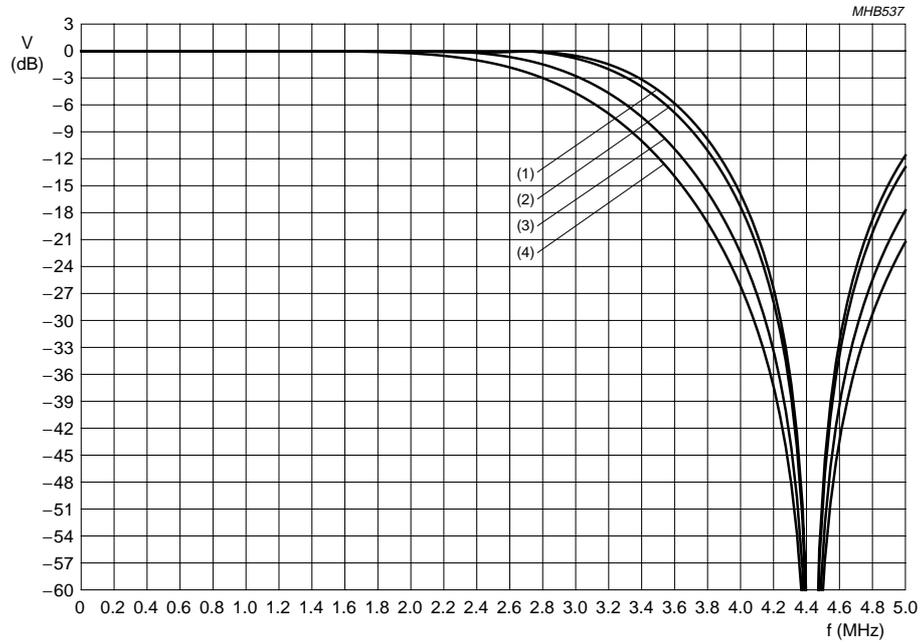

Fig.15 Transfer characteristics of the luminance notch filter in 4.43 MHz mode (Y-comb filter disabled) at LUBW = 0.

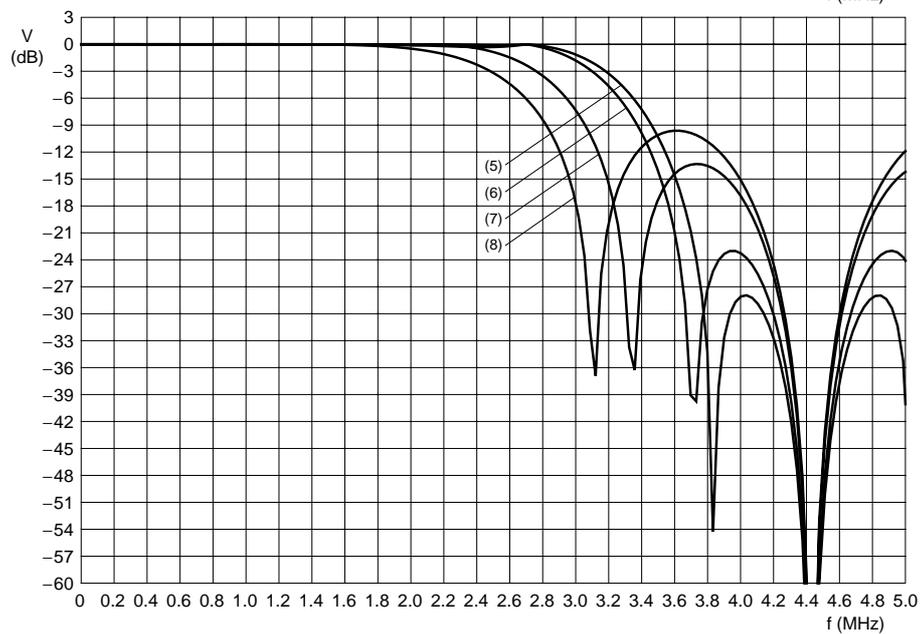

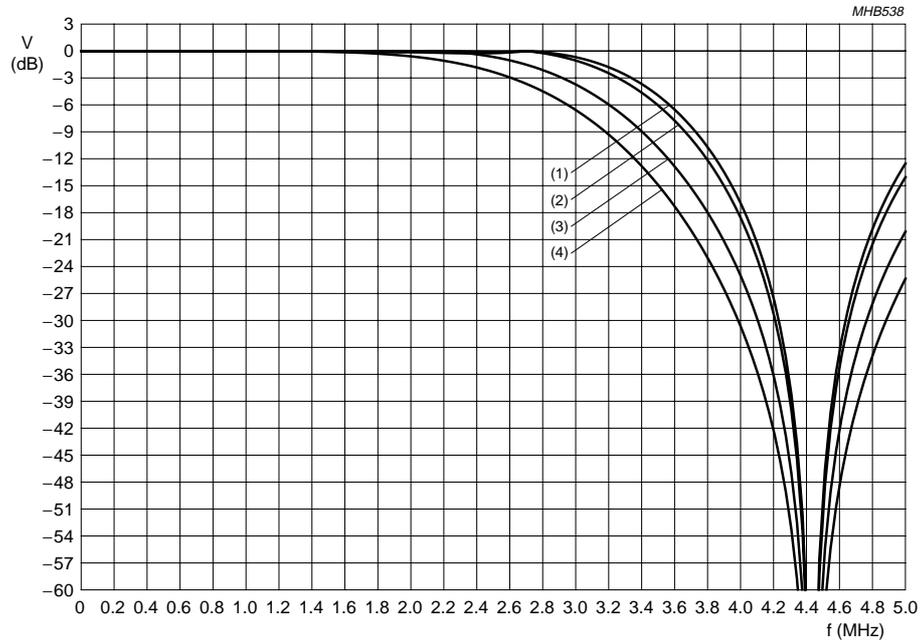

Fig.16 Transfer characteristics of the luminance notch filter in 4.43 MHz mode (Y-comb filter disabled) at LUBW = 1.

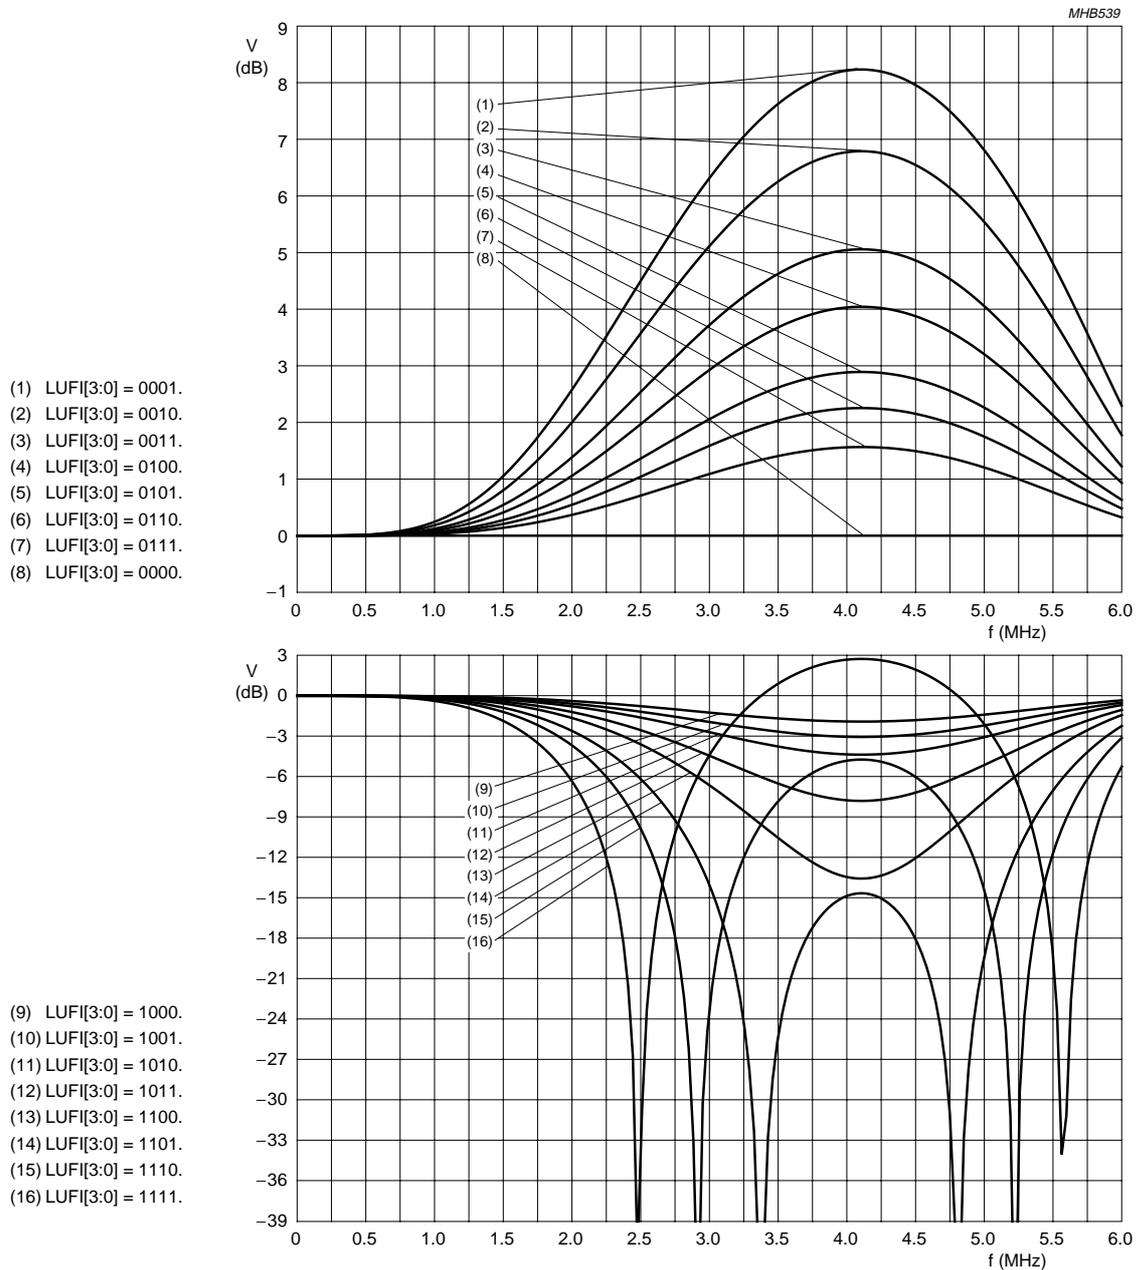

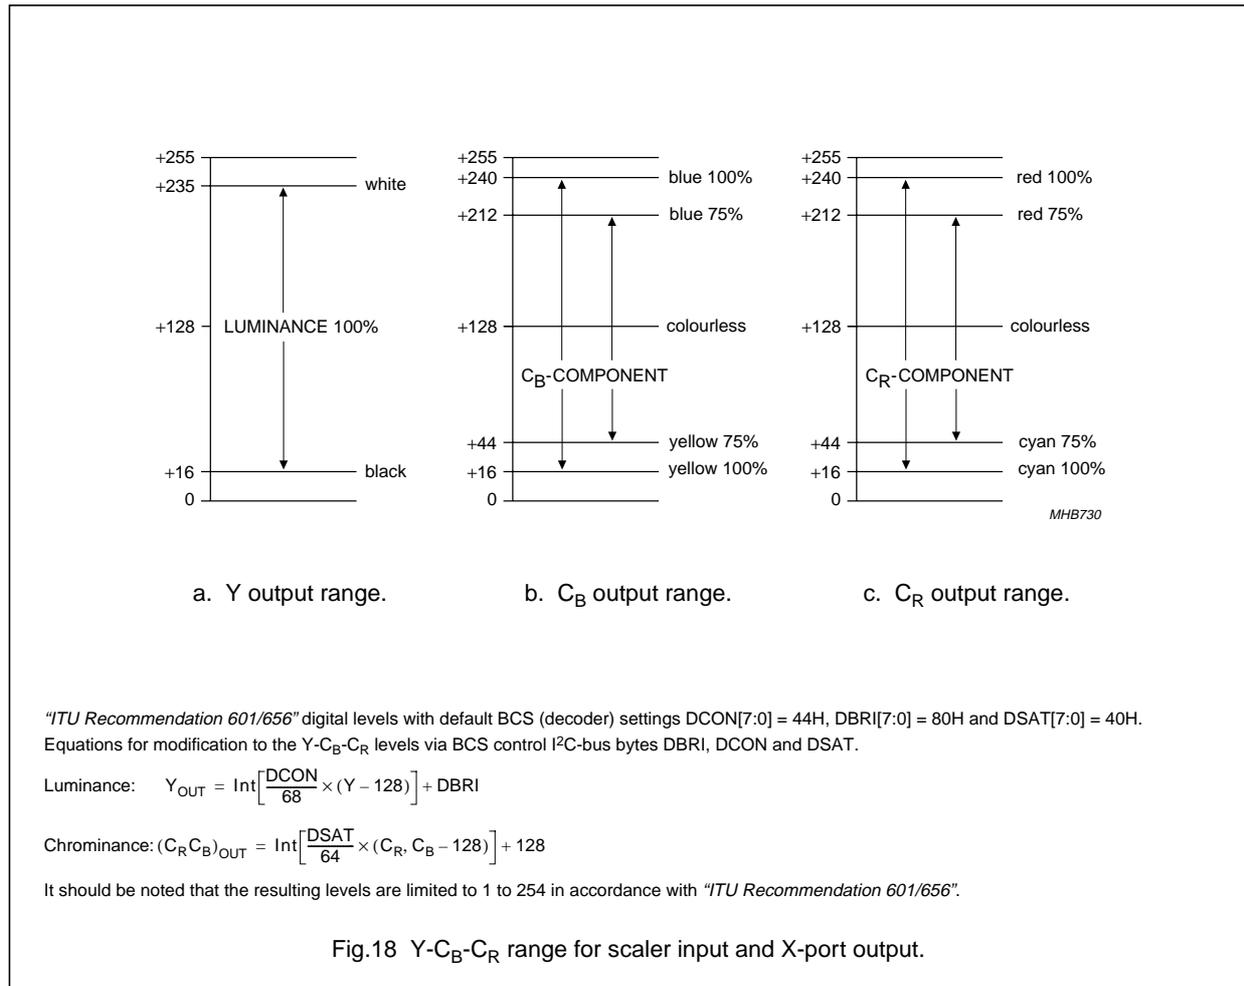

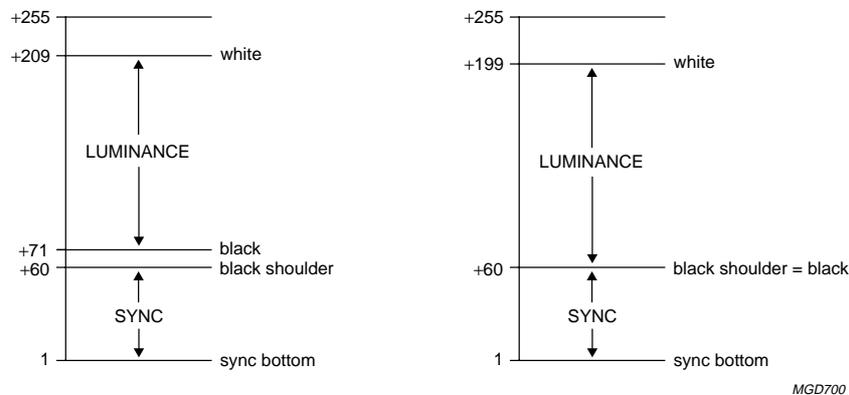

Fig.17 Transfer characteristics of the luminance peaking/low-pass filter (sharpness).

### 8.1.2.3 Brightness Contrast Saturation (BCS) control and decoder output levels

The resulting Y (CVBS) and C<sub>B</sub>-C<sub>R</sub> signals are fed to the BCS block, which contains the following functions:

- Chrominance saturation control by DSAT7 to DSAT0
- Luminance contrast and brightness control by DCON7 to DCON0 and DBRI7 to DBRI0
- Raw data (CVBS) gain and offset adjustment by RAWG7 to RAWG0 and RAWO7 to RAWO0
- Limiting Y-C<sub>B</sub>-C<sub>R</sub> or CVBS to the values 1 (minimum) and 254 (maximum) to fulfil "ITU Recommendation 601/656".

a. Sources containing 7.5 IRE black level offset (e.g. NTSC M).

b. Sources not containing black level offset.

CVBS levels with default settings RAWG[7:0] = 64 and RAWO[7:0] = 128.  
Equation for modification of the raw data levels via bytes RAWG and RAWO:

$$CVBS_{OUT} = \text{Int} \left[ \frac{RAWG}{64} \times (CVBS_{nom} - 128) \right] + RAWO$$

It should be noted that the resulting levels are limited to 1 to 254 in accordance with "ITU Recommendation 601/656".

Fig.19 CVBS (raw data) range for scaler input, data slicer and X-port output.

### 8.1.3 SYNCHRONIZATION

The prefiltered luminance signal is fed to the synchronization stage. Its bandwidth is further reduced to 1 MHz in a low-pass filter. The sync pulses are sliced and fed to the phase detectors where they are compared with the sub-divided clock frequency. The resulting output signal is applied to the loop filter to accumulate all phase deviations. Internal signals (e.g. HCL and HSY) are generated in accordance with analog front-end requirements. The loop filter signal drives an oscillator to generate the line frequency control signal LFCO; see Fig.20.

The detection of 'pseudo syncs' as part of the macrovision copy protection standard is also achieved within the synchronization circuit.

The result is reported as flag COPRO within the decoder status byte at subaddress 1FH.

### 8.1.4 CLOCK GENERATION CIRCUIT

The internal CGC generates all clock signals required for the video input processor.

The internal signal LFCO is a digital-to-analog converted signal provided by the horizontal PLL. It is the multiple of the line frequency:

$$6.75 \text{ MHz} = 429 \times f_H (50 \text{ Hz}), \text{ or}$$

$$6.75 \text{ MHz} = 432 \times f_H (60 \text{ Hz}).$$

The LFCO signal is multiplied by a factor of 2 and 4 in the internal PLL circuit (including phase detector, loop filtering, VCO and frequency divider) to obtain the output clock signals. The rectangular output clocks have a 50% duty factor.

**Table 5** Decoder clock frequencies

| CLOCK           | FREQUENCY (MHz)  |
|-----------------|------------------|
| XTALO           | 24.576 OR 32.110 |
| LLC             | 27               |
| LLC2            | 13.5             |
| LLC4 (INTERNAL) | 6.75             |
| LLC8 (VIRTUAL)  | 3.375            |

#### 8.1.5 POWER-ON RESET AND CHIP ENABLE (CE) INPUT

A missing clock, insufficient digital or analog  $V_{DDA0}$  supply voltages (below 2.8 V) will start the reset sequence; all outputs are forced to 3-state (see Fig.21). The indicator output RES is LOW for approximately 128 LLC after the internal reset and can be applied to reset other circuits of the digital TV system.

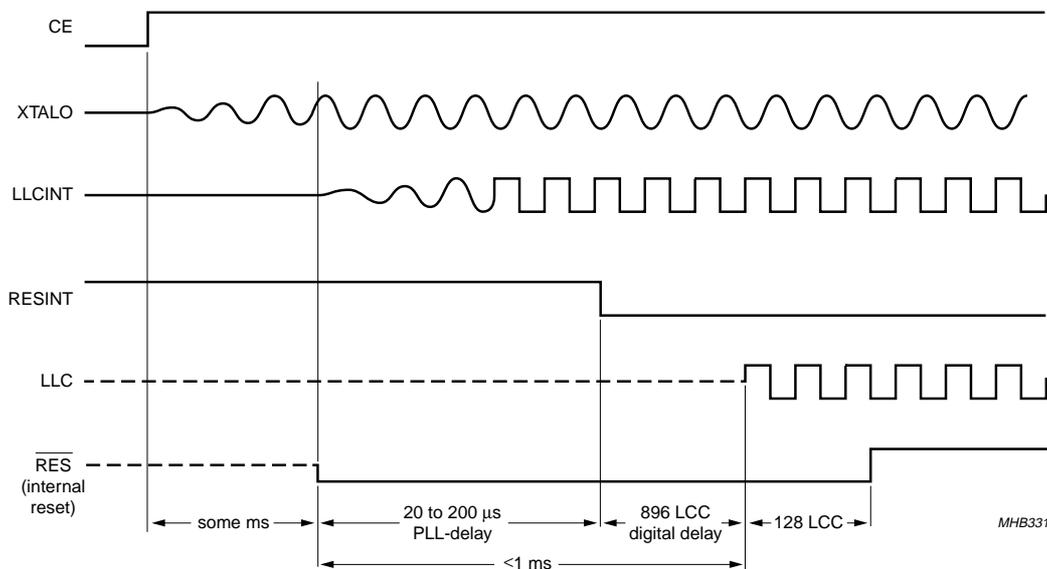

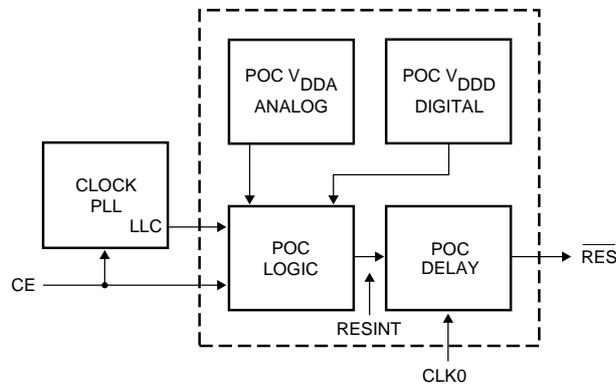

It is possible to force a reset by pulling the Chip Enable pin (CE) to ground. After the rising edge of CE and sufficient power supply voltage, the outputs LLC, LLC2 and SDA return from 3-state to active, while the other signals have to be activated via programming.

However, some external devices require an active clock during reset to avoid hang up. For these applications it is possible to activate both the I-port and/or the X-port outputs by pulling the ITRI- and/or XTRI inputs to logic 1 by an external pull up resistor (4.7 k $\Omega$ ).

In detail: Pulling ITRI to 1 activates the outputs ICLK, IPD[7:0], IDQ, IGPV, IGP0 and IGP1; pulling XTRI to 1 activates the outputs XCLK, XPD[7:0], XDQ, XRH and XRV. During reset both ICLK and XCLK deliver the LLC-clock (27 MHz) generated by the internal decoder PLL.

If ITRI and/or XTRI are not connected, an internal pull up resistor takes care that these pins remain in 3-state.

In any case it is possible to force these ports to 3-state by setting XPE[1:0] and/or IPE[1:0] to 00.

POC = Power-on Control.  
 CE = chip enable input.  
 XTALO = crystal oscillator output.  
 LLCINT = internal system clock.  
 RESINT = internal reset.  
 LLC = line-locked clock output, occurs also on pins XCLK and/or ICLK if enabled via pull up resistor on XTRI and/or ITRI.  
 $\overline{\text{RES}}$  = reset output.

Fig.21 Power-on control circuit.

## 8.2 Output Formatter

The Output Formatter of the decoder part contains the ITU 656 8 bit / 10 bit formatter for the expansion port (X-Port) data output (XPD[7:0], XRH, XRV) including the selection of the reference signals for the RT port (RTCO, RTS0 and RTS1) and the expansion port (XRH, XRV and XDQ) (for a detailed description see Section 9.4.1) as well as the control circuitry for the signals needed for the internal paths to the scaler and data slicer part.

This control circuitry requests decoded video data (Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2) or raw data from the combfilter decoder output to be provided to expansion port (X-Port) output, to the scaler input and to the VBI data slicer input. This data request is user controlled by the line control registers LCR2 to LCR24 (see also Chapter 16; subaddresses 41H to 57H).

Each of the registers LCR2 to LCR23 defines a data type to be decoded in the associated line; i.e.: the VBI data type can be set independently for each of the lines. Therefore LCR2 to LCR23 refer to line numbers. The selection in LCR24 values is valid for the rest of the corresponding field. The upper nibble of each of the 23 LCR registers contains the value for field 1 (odd), the lower nibble for field 2 (even). The relationship between LCR values and line numbers can be adjusted via VOFF8 to VOFF0, located in subaddresses 5BH (bit 4) and 5AH (bits 7 to 0), FOFF subaddress 5BH (bit D7) and VEP subaddress 5BH (bit D5). The recommended values are VOFF[8:0] = 03H for 50 Hz sources (with FOFF = 0) and VOFF[8:0] = 06H for 60 Hz sources (with FOFF = 1), to accommodate line number conventions as used for PAL, SECAM and NTSC standards; see Tables 7 to 10.

**Note:** The line counting scheme for 60 Hz standards, with VOFF = 0x06, as mentioned in Fig.23, table 7 and table 8, leads the VBI slicer to take the old field ID as reference for it's field processing. For consistent ID interpretation the VOFF value need to be set to 0x03.

**Table 6** Data formats at decoder output

| Data type |        | 60Hz / 525 Lines VBI Data Standards |  | 50Hz / 625 Lines VBI Data Standards          |  |

The adjustment of the slicer processing, the adjustment of video output data via the expansion port (X-Port) and the adjustment of video data transferred to the scaler relative to the input signal source is defined by the programming

registers 59h to 5BH, There are programmable offsets in the horizontal and vertical direction available: parameters HOFF[10:0] 5BH[2:0] 59H[7:0], VOFF[8:0] 5BH[4] 5AH[7:0], FOFF[5BH[7]] and VEP[5BH[5]]. I.e. these control registers are defining the decoder data output format - active video, raw samples (optionally a test line), which is delivered from combfilter video decoder output to the expansion port output, the scaler and the VBI Data Slicer.

**Table 7** Relationship of LCR to line numbers in 525 lines/60 Hz systems (part 1)

Vertical line offset, VOFF[8:0] = 06H, resp. 03H (subaddresses 5BH[4] and 5AH[7:0]); horizontal pixel offset, HOFF[10:0] = 347H (subaddresses 5BH[2:0] and 59H[7:0]); FOFF = 1 (subaddress 5BH[7]), VEP = 0 (subaddress 5BH[5])

The relationship of these programming values to the input signal and the recommended values is outlined in table 7 to table 10.

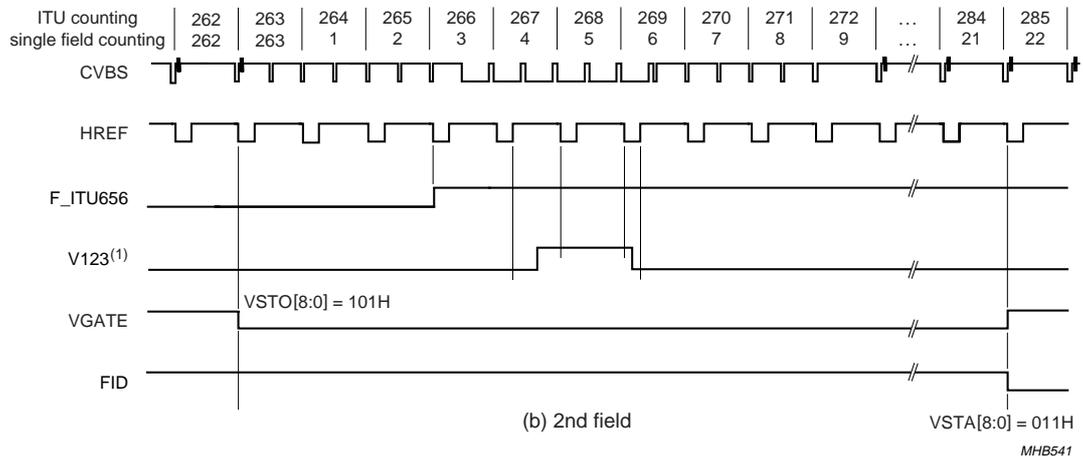

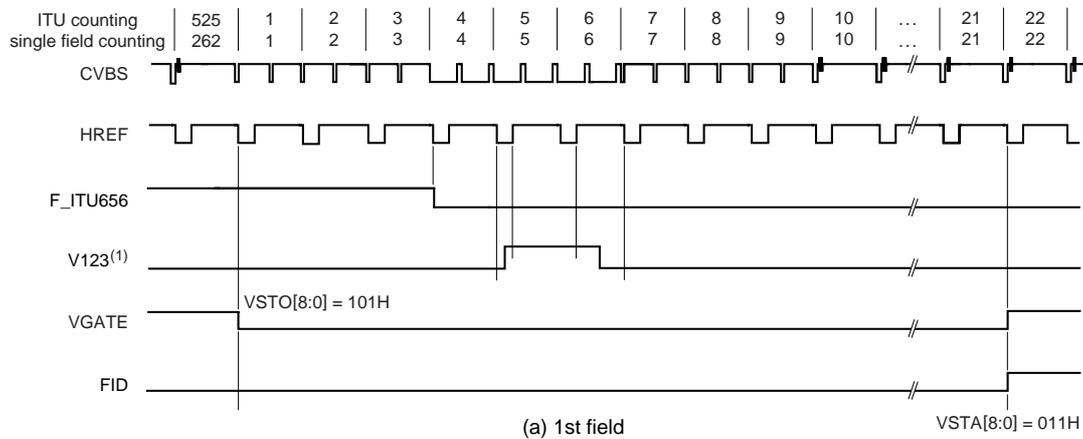

(1) The inactive going edge of the V123 signal indicates whether the field is odd or even. If HREF is active during the falling edge of V123, the field is ODD (field 1). If HREF is inactive during the falling edge of V123, the field is EVEN. The specific position of the slope is dependent on the internal processing delay and may change a few clock cycles from version to version.

The control signals listed above are available on pins RTS0, RTS1, XRH and XRV according to the following table:

| NAME     | RTS0 | RTS1 | XRH | XRV |
|----------|------|------|-----|-----|
| HREF     | X    | X    | X   | -   |
| F_ITU656 | -    | -    | -   | X   |
| V123     | X    | X    | -   | X   |
| VGATE    | X    | X    | -   | -   |
| FID      | X    | X    | -   | -   |

For further information see Section 16.2: Tables 69, 70 and 71.

Fig.22 Vertical timing diagram for 50 Hz/625 line systems.

### 8.3 Scaler

The high performance video scaler in the SAA7115 has the following major blocks:

- Acquisition control (horizontal and vertical timer) and task handling (the region/field/frame based processing)
- Prescaler, for horizontal down-scaling by an integer factor, combined with appropriate band limiting filters, especially anti-aliasing for CIF format
- Brightness, saturation, contrast control to adjust scale dependent amplification
- Line buffer, with asynchronous read and write, to support vertical up-scaling (e.g. for videophone application, converting 240 into 288 lines, Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2)
- Vertical scaling, with phase accurate Linear Phase Interpolation (LPI) for zoom and downscale, or phase accurate Accumulation Mode (ACM) for large downscaling ratios and better alias suppression
- Variable Phase Delay (VPD), operates as horizontal phase accurate interpolation for arbitrary non-integer scaling ratios, supporting conversion between square and rectangular pixel sampling
- Output formatter for scaled Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2, Y-C<sub>B</sub>-C<sub>R</sub> 4 : 1 : 1 and Y only (format also for raw data)
- FIFO, 32-bit wide, with 64 pixel capacity in Y-C<sub>B</sub>-C<sub>R</sub> formats
- Output interface, 8 or 16-bit (only if extended by H-port) data pins wide, synchronous or asynchronous operation, with stream events on discrete pins, or coded in the data stream.

The overall H and V zooming (HV\_zoom) is restricted by the input/output data rate relationships. With a safety margin of 2% for running in and running out,

the maximum HV\_zoom is equal to:  $0.98 \times \frac{T_{\text{input\_field}} - T_{\text{v\_blanking}}}{\text{in\_pixel} \times \text{in\_lines} \times \text{out\_cycle\_per\_pix} \times T_{\text{out\_clk}}}$

For example:

1. Input from decoder: 50 Hz, 720 pixel, 288 lines, 16-bit data at 13.5 MHz data rate, 1 cycle per pixel; output: 8-bit data at 27 MHz, 2 cycles per pixel;

$$\text{the maximum HV\_zoom is about: } 0.98 \times \frac{20 \text{ ms} - 24 \times 64 \text{ } \mu\text{s}}{720 \times 288 \times 2 \times 37 \text{ ns}} = 1.18$$

2. Input from X-port: 60 Hz, 720 pixel, 240 lines, 8-bit data at 27 MHz data rate (ITU 656), 2 cycles per pixel; output via I + H-port: 16-bit data at 27 MHz clock, 1 cycle per pixel;

$$\text{the maximum HV\_zoom is about: } 0.98 \times \frac{16.666 \text{ ms} - 22 \times 64 \text{ } \mu\text{s}}{720 \times 240 \times 1 \times 37 \text{ ns}} = 2.34$$

The data flow in the scaler is controlled by internal data valid and data request flags (internal handshake signalling) between the sub-blocks, as the scaling process itself is discontinuous and dynamical. Therefore the entire scaler acts as a pipeline buffer. Depending on the actually programmed scaling parameters the effective buffer can exceed to an entire line. This allows vertical upscaling, more flexible video stream timing at the image port, discontinuous transfers and handshake. The access/bandwidth requirements to the VGA frame buffer are reduced significantly.

The video scaler receives its input signal from the video decoder or from the expansion port (X-port). It gets 16-bit Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2 input data at a continuous rate of 13.5 MHz from the decoder. Discontinuous data stream can be accepted from the expansion port (X-port), normally 8-bit wide ITU 656 like Y-C<sub>B</sub>-C<sub>R</sub> data, accompanied by a pixel qualifier on XDQ.

The input data stream is sorted into two data paths, one for luminance (or raw samples) and one for time multiplexed chrominance C<sub>B</sub> and C<sub>R</sub> samples. An Y-C<sub>B</sub>-C<sub>R</sub> 4 : 1 : 1 input format from the X-port is converted to 4 : 2 : 2 for the horizontal prescaling and vertical filter scaling operation.

The scaler operation is defined by two programming pages A and B, representing two different tasks, that can be applied field alternating or to define two regions in a field (e.g. with different scaling range, factors and signal source during odd and even fields).

Each programming page contains control:

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

- For signal source selection and formats
- For task handling and trigger conditions
- For input and output acquisition window definition
- For H-prescaler, V-scaler and H-phase scaling.

Raw VBI-data is handled as specific input format and needs its own programming page (equals own task).

In VBI pass through operation the processing of prescaler and vertical scaling has to be set to no-processing, however, the horizontal fine scaling VPD can be activated. Upscaling (oversampling, zooming), free of frequency folding, up to a factor of 3.5 can be achieved, as required by some software data slicing algorithms.

These raw samples are transported through the image port as valid data and can be output as Y only format. Also this Y only lines can be framed by SAV and EAV codes.

### 8.3.1 ACQUISITION CONTROL AND TASK HANDLING (SUBADDRESSES 80H, 90H, 91H, 94H TO 9FH AND C4H TO CFH)

The acquisition control receives horizontal and vertical synchronization signals from the decoder section or from the X-port. The acquisition window is generated via pixel and line counters at the appropriate places in the data path. From X-port only qualified pixels and lines (lines with qualified pixel) are counted.

The acquisition window parameters are as follows:

- Signal source selection regarding input video stream and formats from the decoder, or from X-port (programming bits SCSRC[1:0] 91H[5:4] and FSC[2:0] 91H[2:0])
  - Remark:** The input of raw VBI-data from the internal decoder need to be controlled via the decoder output formatter and the LCR registers (see Section 8.2)
- Vertical offset defined in lines of the video source, parameter YO[11:0] 99H[3:0] 98H[7:0]
- Vertical length defined in lines of the video source, parameter YS[11:0] 9BH[3:0] 9AH[7:0]
- Vertical length defined in number of target lines, as a result of vertical scaling, parameter YD[11:0] 9FH[3:0] 9EH[7:0]
- Horizontal offset defined in number of pixels of the video source, parameter XO[11:0] 95H[3:0] 94H[7:0]
- Horizontal length defined in number of pixels of the video source, parameter XS[11:0] 97H[3:0] 96H[7:0]
- Horizontal destination size, defined in target pixels after fine scaling, parameter XD[11:0] 9DH[3:0] 9CH[7:0].

The source start offset (XO11 to XO0 and YO11 to YO0) opens the acquisition window, and the target size (XD11 to XD0, YD11 to YD0) closes the window, but the window is cut vertically, if there are less output lines than expected. The trigger events for the pixel and line counts are the horizontal and vertical reference edges as defined in subaddress 92H.

The task handling is controlled by subaddress 80H and 90H (see Section 8.3.1.2).

To support instable non standard input signals, different operational modes are implemented (bits CMOD and FMOD).

#### 8.3.1.1 Input field processing

The scaler directly gets a corresponding field ID information from the SAA7115 decoder path.

If switched to the X-port, the trigger event for the field sequence detection from external signals (X-port) are defined in subaddress 92H. From the X-port the state of the scalers H-reference signal at the time of the V-reference edge is taken as field sequence identifier FID. For example, if the falling edge of the XRV input signal is the reference and the state of XRH input is logic 0 at that time, the detected field ID is logic 0.

The bits XFDV[92H[7]] and XFDH[92H[6]] define the detection event and state of the flag from the X-port. For the default setting of XFDV and XFDH at '00' the state of the H-input at the falling edge of the V-input is taken.

The FID flag is used to determine whether the first or second field of a frame is going to be processed within the scaler and it is used as trigger condition for the task handling (see bits STRC[1:0] 90H[1:0]).

According to ITU 656, when FID is at logic 0 means first field of a frame. To ease the application, the polarities of the detection results on the X-port signals and the internal decoder ID can be changed via XFDH.

As the V-sync from the decoder path has a half line timing (due to the interlaced video signal), but the scaler processing only knows about full lines, during 1st fields from the decoder the line count of the scaler possibly shifts by one line, compared to the 2nd field. This can be compensated for by switching the V-trigger event, as defined by XDVO, to the opposite V-sync edge or by using the vertical scalers phase offsets. The vertical timing of the decoder can be seen in Figs 22 and 23.

As the H and V reference events inside the ITU 656 data stream (from X-port) and the real-time reference signals from the decoder path are processed differently, the trigger events for the input acquisition also have to be programmed differently.

**Table 11** Processing trigger and start

| DESCRIPTION  | XDV1<br>92H[5] | XDVO<br>92H[4] | XDH<br>92H[2] |
|--|----------------|----------------|---------------|
| <b>Internal decoder:</b> The processing triggers at the reference edge of the V123 pulse (see Figs 22 (50 Hz) and 23 (60 Hz)), and starts earliest with the rising edge of the decoder HREF at line number:<br>falling edge: 4/7 (50/60 Hz, 1st field), resp. 3/6 (50/60 Hz, 2nd field) (decoder count)<br>rising edge: 2/5 (50/60 Hz, 1st field), resp. 2/5 (50/60 Hz, 2nd field) (decoder count) | 0<br>0         | 1<br>0         | 0<br>0        |
| <b>External ITU 656 stream:</b> The processing starts earliest with SAV at line number 23 (50 Hz system), respectively line 20 (60 Hz system) (according to ITU 656 count)   | 0              | 0              | 0             |

### 8.3.1.2 Task handling

The task handler controls the switching between the two programming register sets. The main function is controlled by subaddresses 90H and C0H.

The operational modes of the task handler are controlled by the bits CMOD[80H[7]] and FMOD[9bH[7]].

A task is enabled via the global control bits TEA[80H[4]] and TEB[80H[5]].

The handler is then triggered by events, which can be defined for each register set.

In case of a programming error the task handling and the complete scaler can be reset to the initial states by setting the software reset bit SWRST[88H[5]] to logic 0. Especially if the programming registers, related acquisition window and scale are reprogrammed while a task is active, a software reset **MUST** be performed after programming.

Contrary to the disabling/enabling of a task, which is evaluated at the end of a running task, when SWRST is at logic 0 it sets the internal state machines directly to their idle states.

The basic operation of the task handler is strongly orientated on the window definitions, which means, if a starting point (in terms of XO and YO values) is missed, or the window definition (especially in terms of the (YO + YS) value) is larger than the input field, the operation is inhibited or incoming video fields are skipped.

To better support non standard input signals and signal sources with varying field lengths (like a VCR in fast forward/rewind mode), there are now some different operational modes implemented for the task handling.

#### Field Mode (bit FMOD [9BH[7]])

This is a task specific bit (for flexibility reasons), but normally both tasks should be programmed to the same value.

If the FMOD bit is set to '1' the YO and YS parameters change the meaning.

YO defines the start line and YS the end line (instead of the window length) for the scalers processing window.

Additionally the trigger conditions of the task handler are changed.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

In 'field mode' the vertical trigger event gets higher priority than the vertical window definition.

The processing is normally started at line number YO and ends at line number YS, but

- if a vertical trigger occurs, before the line number YS is reached, the field processing is terminated and the next task is checked

- if the actual line count at V-trigger is between the YO and the YS value, the task processing is started, also if the line number YO is missed.

Continuous Mode (bit CMOD [80H[7]])

Applications, which do not use the vertical scaling, may take advantage from the 'continuous processing mode'. In this mode a task is started via the SWRST bit and the task enable bits TEA or TEB. The horizontal window definition keeps its meaning, but YO and YS are ignored. The vertical blanking scheme is defined by the selected V-sync (see bits V\_EAV). Once started, the vertical retrigger pulses from the input are ignored and SWRST at '0' is needed to stop the task processing.

Start, Repeat and Skip

The start condition for the handler is defined by bits STRC[1:0] 90H[1:0] and means: start immediately, wait for next V-sync, next FID at logic 0 or next FID at logic 1. The FID is evaluated, if the vertical and horizontal offsets are reached.

When RPTSK[90H[2]] is at logic 1 the actual running task is repeated (under the defined trigger conditions), before handing control over to the alternate task.

To support field rate reduction, the handler is also enabled to skip fields (bits FSKP[2:0] 90H[5:3]) before executing the task. A TOGGLE flag is generated (used for the correct output field processing), which changes state at the beginning of a task, every time a task is activated. Examples are given in Section 8.3.1.3.

#### Remarks:

- **To activate a task the start condition must be fulfilled and, in case of FMOD = 0, the acquisition window offsets must be reached.**

For example, in case of 'start immediately', and two regions are defined for one field, the offset of the lower region must be greater than (offset + length) the upper region, if not, the actual counted H and V position at the end of the upper task is beyond the programmed offsets and the processing will 'wait for next V'.

- **Basically the trigger conditions are checked, when a task is activated.** It is important to realize, that they are not checked while a task is inactive. So you can not trigger to next logic 0 or logic 1 with overlapping offset and active video ranges between the tasks (e.g. task A STRC[2:0] = 2, YO[11:0] = 310 and task B STRC[2:0] = 3, YO[11:0] = 310 results in output field rate of  $\frac{50}{3}$  Hz).
- **After power-on or software reset (via SWRST[88H[5]]) task B gets priority over task A.**

#### 8.3.1.3 Output field processing

As a reference for the output field processing, two signals are available for the back-end hardware.

These signals are the input field ID from the scaler source and a TOGGLE flag, which shows that an active task is used an odd (1, 3, 5...) or even (2, 4, 6...) number of times. Using a single or both tasks and reducing the field or frame rate with the task handling functionality, the TOGGLE information can be used, to reconstruct an interlaced scaled picture at a reduced frame rate. The TOGGLE flag isn't synchronized to the input field detection, as it is only dependent on the interpretation of this information by the external hardware, whether the output of the scaler is processed correctly (see Section 8.3.3).

With OFIDC = 0, the scalers input field ID is available as output field ID on bit D6 of SAV and EAV, respectively on pin IGP0 (IGP1), if FID output is selected.

When OFIDC[90H[6]] = 1, the TOGGLE information is available as output field ID on bit D6 of SAV and EAV, respectively on pin IGP0 (IGP1), if FID output is selected.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

Additionally the bit D7 of SAV and EAV can be defined via CONLH[90H[7]]. CONLH[90H[7]] = 0 (default) sets D7 to logic 1, a logic 1 inverts the SAV/EAV bit D7. So it is possible to mark the output of the both tasks by different SAV/EAV codes. This bit can also be seen as 'task flag' on the pins IGP0 (IGP1), if TASK output is selected.

**Notes**

1. Single task every field; OFIDC = 0; subaddress 90H at 40H; TEB[80H[5]] = 0.
2. Tasks are used to scale to different output windows, priority on task B after SWRST.
3. Both tasks at 1/2 frame rate; OFIDC = 0; subaddresses 90H at 43H and C0H at 42H.
4. In examples 3 and 4 OFIDC = 1, thus the association between input FID and tasks may be flipped, dependent on which time the SWRST is deasserted.
5. Task B at 2/3 frame rate constructed from neighbouring motion phases; task A at 1/3 frame rate of equidistant motion phases; subaddresses 90H at 41H and C0H at 45H.
6. Task A and B at 1/3 frame rate of equidistant motion phases; subaddresses 90H at 41H and C0H at 49H.
7. Due to no data output for this field, the state of the prior field is hold.
8. It is assumed that input/output FID = 0 (= upper lines); UP = upper lines; LO = lower lines.
9. O = data output; NO = no output.

### 8.3.2 HORIZONTAL SCALING

The overall horizontal required scaling factor has to be split into a binary and a rational value according to the equation:

With H-scale ratio =  $\frac{\text{output pixel}}{\text{input pixel}}$  there is

$$\text{H-scale ratio} = \frac{1}{\text{XPSC}[5:0]} \times \frac{1024}{\text{XSCY}[12:0]}$$

where the parameter of prescaler  $\text{XPSC}[5:0] = 1$  to 63 and the parameter of VPD phase interpolation  $\text{XSCY}[12:0] = 300$  to 8191 (0 to 299 are only theoretical values). For example,  $\frac{1}{3.5}$  is to split in  $\frac{1}{4} \times 1.14286$ . The binary factor is processed by the prescaler, the arbitrary non-integer ratio is achieved via the variable phase delay VPD circuitry, called horizontal fine scaling. The latter calculates horizontally interpolated new samples with a 6-bit phase accuracy, which relates to less than 1 ns jitter for regular sampling scheme. Prescaler and fine scaler create the horizontal scaler of the SAA71157115.

Using the accumulation length function of the prescaler ( $\text{XACL}[5:0]$   $\text{A1H}[5:0]$ ), application and destination dependent (e.g. scale for display or for a compression machine), a compromise between visible bandwidth and alias suppression can be determined.

#### 8.3.2.1 Horizontal prescaler (subaddresses A0H to A7H and D0H to D7H)

The prescaling function consists of an FIR anti-alias filter stage and an integer prescaler, which creates an adaptive prescale dependent low-pass filter to balance sharpness and aliasing effects.

The FIR prefilter stage implements different low-pass characteristics to reduce alias for downscales in the range of 1 to  $\frac{1}{2}$ . A CIF optimized filter is built-in, which reduces artefacts for CIF output formats (to be used in combination with the prescaler set to  $\frac{1}{2}$  scale); see Table 13.

Fade-in and fade-out of the filters is achieved by copying an original source sample each as first and last pixel after prescaling.

Figs 25 and 26 show the frequency characteristics of the selectable FIR filters.

**Table 13** FIR prefilter functions

| PFUV[1:0] A2H[7:6]<br>PFY[1:0] A2H[5:4] | LUMINANCE FILTER COEFFICIENTS | CHROMINANCE COEFFICIENTS |
|---|-------------------------------|--------------------------|
| 00                                      | bypassed                      | bypassed                 |
| 01                                      | 1 2 1                         | 1 2 1                    |
| 10                                      | -1 1 1.75 4.5 1.75 1 -1       | 3 8 10 8 3               |
| 11                                      | 1 2 2 2 1                     | 1 2 2 2 1                |

The function of the prescaler is defined by:

- An integer prescaling ratio  $\text{XPSC}[5:0]$   $\text{A0H}[5:0]$  (equals 1 to 63), which covers the integer downscale range 1 to  $\frac{1}{63}$
- An averaging sequence length  $\text{XACL}[5:0]$   $\text{A1H}[5:0]$  (equals 0 to 63); range 1 to 64
- A DC gain renormalization  $\text{XDCG}[2:0]$   $\text{A2H}[2:0]$ ; 1 down to  $\frac{1}{128}$
- The bit  $\text{XC2\_1}[\text{A2H}[3]]$ , which defines the weighting of the incoming pixels during the averaging process:
  - $\text{XC2\_1} = 0 \Rightarrow 1 + 1 \dots + 1 + 1$
  - $\text{XC2\_1} = 1 \Rightarrow 1 + 2 \dots + 2 + 1$

The prescaler creates a prescale dependent FIR low-pass, with up to  $(64 + 7)$  filter taps. The parameter  $\text{XACL}[5:0]$  can be used to vary the low-pass characteristic for a given integer prescale of  $\frac{1}{\text{XPSC}[5:0]}$ . The user can therewith decide between signal bandwidth (sharpness impression) and alias.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

**Remark:** Due to bandwidth considerations XPSC[5:0] and XACL[5:0] can be chosen different to the mentioned equations or Table 14, as the H-phase scaling is able to scale in the range from zooming up by factor 3 to downscale by a factor of  $1024/8191$ .

Equation for XPSC[5:0] calculation is:  $XPSC[5:0] = \text{lower integer of } \frac{N_{pix\_in}}{N_{pix\_out}}$

where,

the range is 1 to 63 (**value 0 is not allowed**);

Npix\_in = number of input pixel, and

Npix\_out = number of desired output pixel over the complete horizontal scaler.

**The use of the prescaler results in a XACL[5:0] and XC2\_1 dependent gain amplification.**

The amplification can be calculated according to the equation:

$$DC \text{ gain} = (XC2\_1 + 1) \times XACL[5:0] + (1 - XC2\_1).$$

It is recommended to use sequence lengths and weights, which results in a DC gain amplification of  $2^N$ , as these amplitudes can be renormalized by the XDCG[2:0] controlled  $\frac{1}{2^N}$  shifter of the prescaler.

Other amplifications have to be normalized by using the following BCS control circuitry according to the equation:

$$CONT[7:0] = SATN[7:0] = \text{lower integer of } \frac{2^{XDCG[2:0]}}{DC \text{ gain} \times 64}$$

Where:  $2^{XDCG[2:0]} \geq DC \text{ gain}$

In these cases the prescaler has to be set to an overall gain of  $\leq 1$ , e.g. for an accumulation sequence of '1 + 1 + 1' (XACL[5:0] = 2 and XC2\_1 = 0), XDCG[2:0] must be set to '010', this equals  $\frac{1}{4}$  and the BCS has to amplify the signal to  $\frac{4}{3}$  (SATN[7:0] and CONT[7:0] value = lower integer of  $\frac{4}{3} \times 64$ ).

**The use of XACL[5:0] is XPSC[5:0] dependent. XACL[5:0] must be  $< 2 \times XPSC[5:0]$ .**

XACL[5:0] can be used to find a compromise between bandwidth (sharpness) and alias effects.

Figs 27 and 28 show some resulting frequency characteristics of the prescaler.

Table 14 shows the recommended prescaler programming. Other programming settings, than given in Table 14, may result in better alias suppression, but the resulting DC gain amplification needs to be compensated by the BCS control

For example, if XACL[5:0] = 5, XC2\_1 = 1, then the DC gain = 10 and the required XDCG[2:0] = 4.

The horizontal source acquisition timing and the prescaling ratio is identical for both the luminance path and chrominance path, but the FIR filter settings can be defined differently in the two channels.

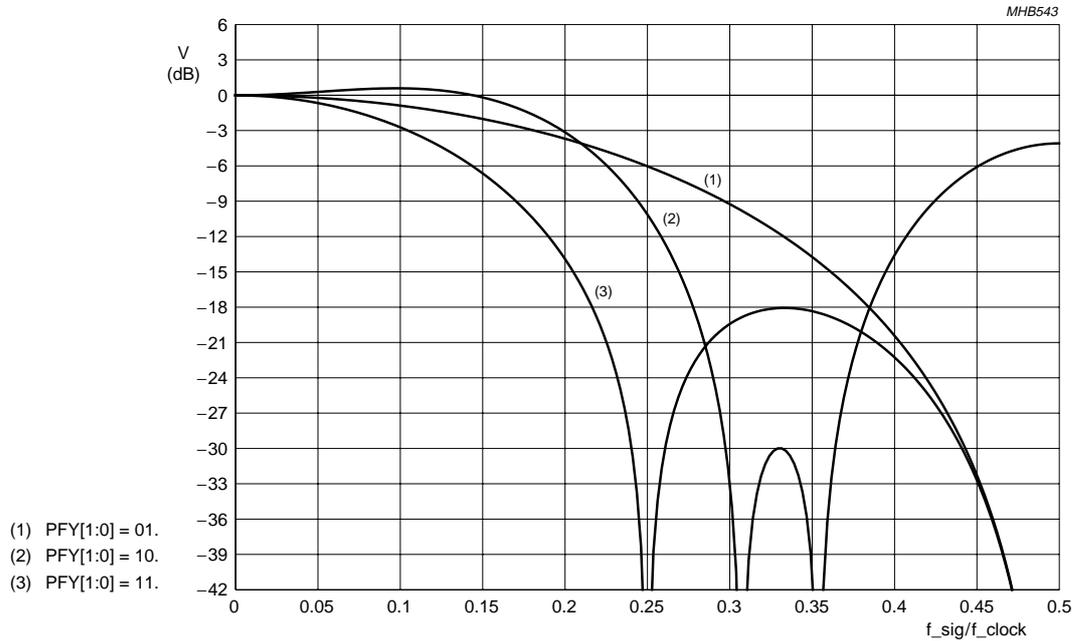

Fig.25 Luminance prefilter characteristic.

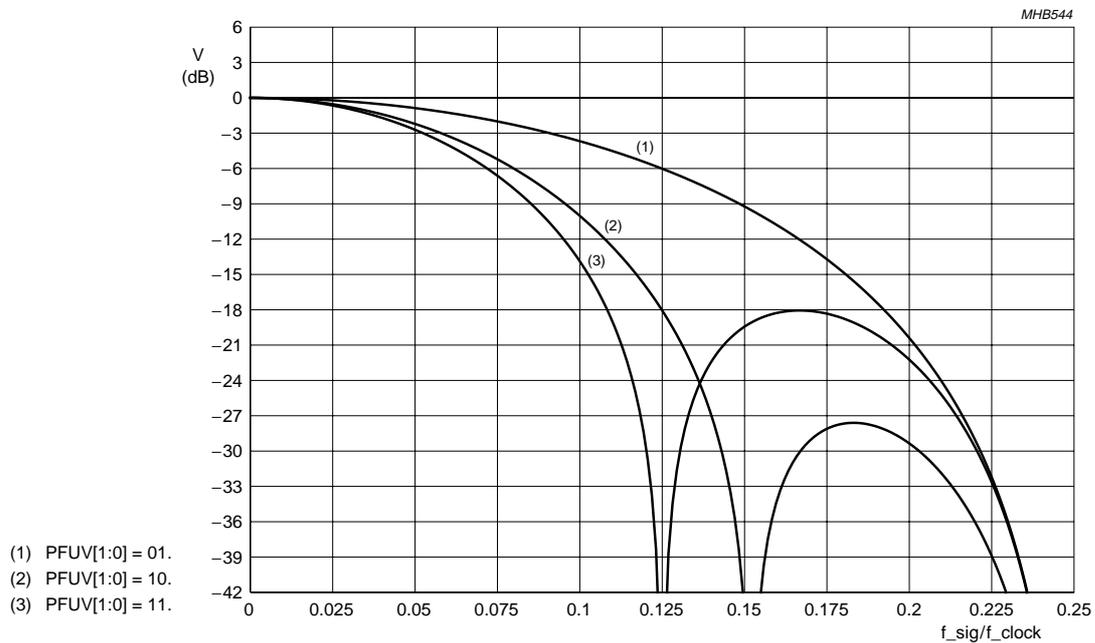

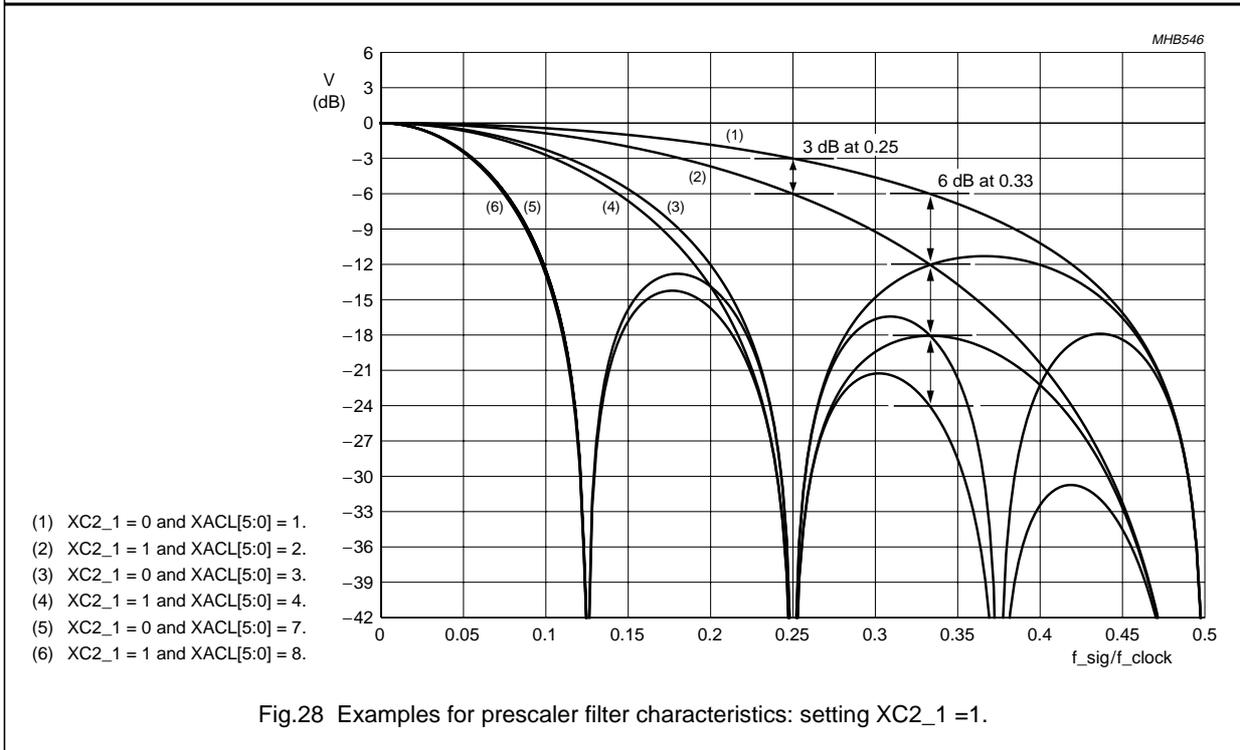

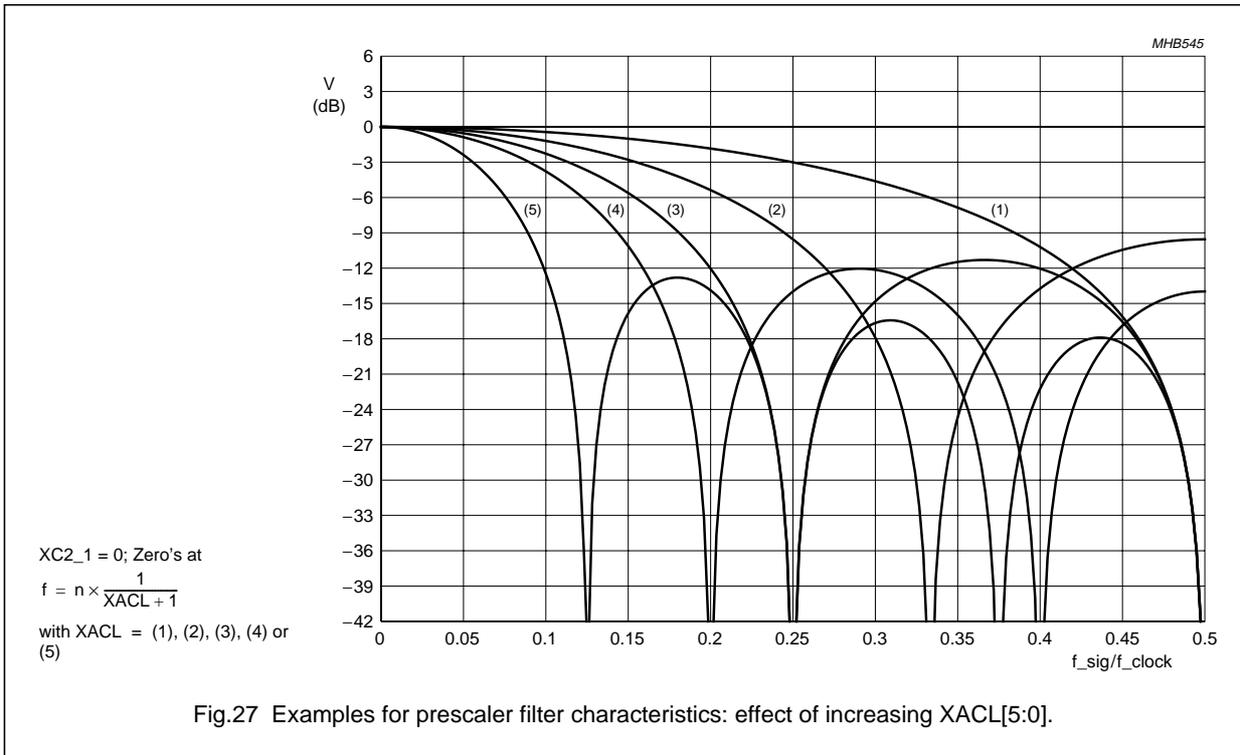

Fig.26 Chrominance prefilter characteristic.

**Table 14** XACL[5:0] example of usage

| PRESCALE RATIO | XPSC [5:0] | RECOMMENDED VALUES  |       |           |   |       |           | FIR PREFILTER PFY (P <sub>B</sub> -P <sub>R</sub> ) |
|----------------|------------|---|-------|-----------|---|-------|-----------|---|

### 8.3.2.2 Horizontal fine scaling (variable phase delay filter; subaddresses A8H to AFH and D8H to DFH)

The horizontal fine scaling (VPD) should operate at scaling ratios between  $\frac{1}{2}$  and 2 (0.8 and 1.6), but can also be used for direct scaling in the range from  $\frac{1}{7.999}$  to (theoretical) zoom 3.5 (restriction due to the internal data path architecture), without prescaler.

In combination with the prescaler a compromise between sharpness impression and alias can be found, which is signal source and application dependent.

For the luminance channel a filter structure with 10 taps is implemented, and for the chrominance a filter with 4 taps.

Luminance and chrominance scale increments (XSCY[12:0] A9H[4:0]A8H[7:0] and XSCC[12:0] ADH[4:0]ACH[7:0]) are defined independently, but must be set in a 2 : 1 relationship in the actual data path implementation. The phase offsets XPHY[7:0] AAH[7:0] and XPHC[7:0] AEH[7:0] can be used to shift the sample phases slightly. XPHY[7:0] and XPHC[7:0] covers the phase offset range  $7.999T$  to  $\frac{1}{32}T$ . The phase offsets should also be programmed in a 2 : 1 ratio.

The underlying phase controlling DTO has a 13-bit resolution.

According to the equations  $XSCY[12:0] = 1024 \times \frac{N_{pix\_in}}{XPSC[5:0]} \times \frac{1}{N_{pix\_out}}$  and  $XSCC[12:0] = \frac{XSCY[12:0]}{2}$

the VPD covers the scale range from 0.125 to zoom 3.5. VPD acts equivalent to a polyphase filter with 64 possible phases. In combination with the prescaler, it is possible to get very accurate samples from a highly anti-aliased integer downscaled input picture.

### 8.3.3 VERTICAL SCALING

The vertical scaler of the SAA7115 consists of a line FIFO buffer for line repetition and the vertical scaler block, which implements the vertical scaling on the input data stream in 2 different operational modes from theoretical zoom by 64 down to icon size  $\frac{1}{64}$ . The vertical scaler is located between the BCS and horizontal fine scaler, so that the BCS can be used to compensate the DC gain amplification of the ACM mode (see Section 8.3.3.2) as the internal RAMs are only 8-bit wide.

#### 8.3.3.1 Line FIFO buffer (subaddresses 91H, B4H and C1H, E4H)

The line FIFO buffer is a dual ported RAM structure for 768 pixels, with asynchronous write and read access. The line buffer can be used for various functions, but not all functions may be available simultaneously.

The line buffer can buffer a complete unscaled active video line or more than one shorter lines (only for non-mirror mode), for selective repetition for vertical zoom-up.

For zooming up 240 lines to 288 lines e.g., every fourth line is requested (read) twice from the vertical scaling circuitry for calculation.

For conversion of a 4 : 2 : 0 or 4 : 1 : 0 input sampling scheme (MPEG, video phone, Indeo YUV-9) to ITU like sampling scheme 4 : 2 : 2, the chrominance line buffer is read twice or four times, before being refilled again by the source. It has to be preserved by means of the input acquisition window definition, so that the processing starts with a line containing luminance and chrominance information for 4 : 2 : 0 and 4 : 1 : 0 input. The bits FSC[2:1] 91H[2:1] define the distance between the Y/C lines. In the case of 4 : 2 : 2 and 4 : 1 : 1 FSC2 and FSC1 have to be set to '00'.

The line buffer can also be used for mirroring, i.e. for flipping the image left to right, for the vanity picture in video phone applications (bit YMIR[B4H[4]]). In mirror mode only one active prescaled line can be held in the FIFO at a time.

The line buffer can be utilized as an excessive pipeline buffer for discontinuous and variable rate transfer conditions at the expansion port or image port.

**Remark to 4 : X : 0 input from X-port:** These input streams need to look like regular 4:2:2 input and are formatted to the internal 16 bit YUV format. At it's input port the line fifo only ignores 1 of 2, resp. 3 of 4 chrominance lines, where FSC defines the skipping sequence.

### 8.3.3.2 Vertical scaler (subaddresses B0H to BFH and E0H to EFH)

Vertical scaling of any ratio from 64 (theoretical zoom) to  $\frac{1}{63}$  (icon) can be applied.

The vertical scaling block consists of another line delay, and the vertical filter structure, that can operate in two different modes; Linear Phase Interpolation (LPI) and accumulation (ACM) mode. These are controlled by YMODE[B4H[0]]:

- **LPI mode:** In LPI mode (YMODE = 0) two neighbouring lines of the source video stream are added together, but weighted by factors corresponding to the vertical position (phase) of the target output line relative to the source lines. This linear interpolation has a 6-bit phase resolution, which equals 64 intra line phases. It interpolates between two consecutive input lines only. LPI mode should be applied for scaling ratios around 1 (down to  $\frac{1}{2}$ ), **it must be applied for vertical zooming.**
- **ACM mode:** The vertical Accumulation (ACM) mode (YMODE = 1) represents a vertical averaging window over multiple lines, sliding over the field. This mode also generates phase correct output lines. The averaging window length corresponds to the scaling ratio, resulting in an adaptive vertical low-pass effect, to greatly reduce aliasing artefacts. ACM can be applied for downscales only from ratio 1 down to  $\frac{1}{64}$ . ACM results in a scale dependent **DC gain amplification**, which has to be precorrected by the BCS control of the scaler part.

The phase and scale controlling DTO calculates in 16-bit resolution, controlled by parameters YSCY[15:0] B1H[7:0] B0H[7:0] and YSCC[15:0] B3H[7:0] B2H[7:0], continuously over the entire field. A start offset can be applied to the phase processing by means of the parameters YPY3[7:0] to YPY0[7:0] in BFH[7:0] to BCH[7:0] and YPC3[7:0] to YPC0[7:0] in BBH[7:0] to B8H[7:0]. The start phase covers the range of  $\frac{255}{32}$  to  $\frac{1}{32}$  lines offset.

By programming appropriate, opposite, vertical start phase values (subaddresses B8H to BFH and E8H to EFH) depending on odd/even field ID of the source video stream and A/B-page cycle, frame ID conversion and field rate conversion are supported (i.e. de-interlacing, re-interlacing).

Figs 29 and 30 and Tables 15 and 16 describe the use of the offsets.

**Remark: The vertical start phase, as well as scaling ratio are defined independently for luminance and chrominance channel, but must be set to the same values in the actual implementation for accurate 4 : 2 : 2 output processing.**

The vertical processing communicates on its input side with the line FIFO buffer. The scale related equations are:

- Scaling increment calculation for ACM and LPI mode, downscale and zoom:

$$YSCY[15:0] \text{ and } YSCC[15:0] = \text{lower integer of } \left( 1024 \times \frac{N_{\text{line\_in}}}{N_{\text{line\_out}}} \right)$$

- BCS value to compensate DC gain in ACM mode (contrast and saturation have to be set):

$$\text{CONT}[7:0] \text{ A5H}[7:0] \text{ respectively SATN}[7:0] \text{ A6H}[7:0] = \text{lower integer of } \left( \frac{N_{\text{line\_out}}}{N_{\text{line\_in}}} \times 64 \right),$$

$$\text{or} \quad = \text{lower integer of } \left( \frac{1024}{YSCY[15:0]} \times 64 \right)$$

### 8.3.3.3 Use of the vertical phase offsets

As described in Section 8.3.1.3, the scaler processing may run randomly over the interlaced input sequence (see parameters STRC[1:0], FSKP[2:0] and RPTSK). Additionally the interpretation and timing between ITU 656 field ID and real-time detection by means of the state of H-sync at the falling edge of V-sync may result in different field ID interpretation.

A vertically scaled interlaced output also gets a larger vertical sampling phase error, if the interlaced input fields are processed, without regard to the actual scale at the starting point of operation (see Fig.29).

For correct interlaced processing the vertical scaler must be used with respect to the interlace properties of the input signal and, if required, for conversion of the field sequences.

Four events should be considered, they are illustrated in Fig.30.

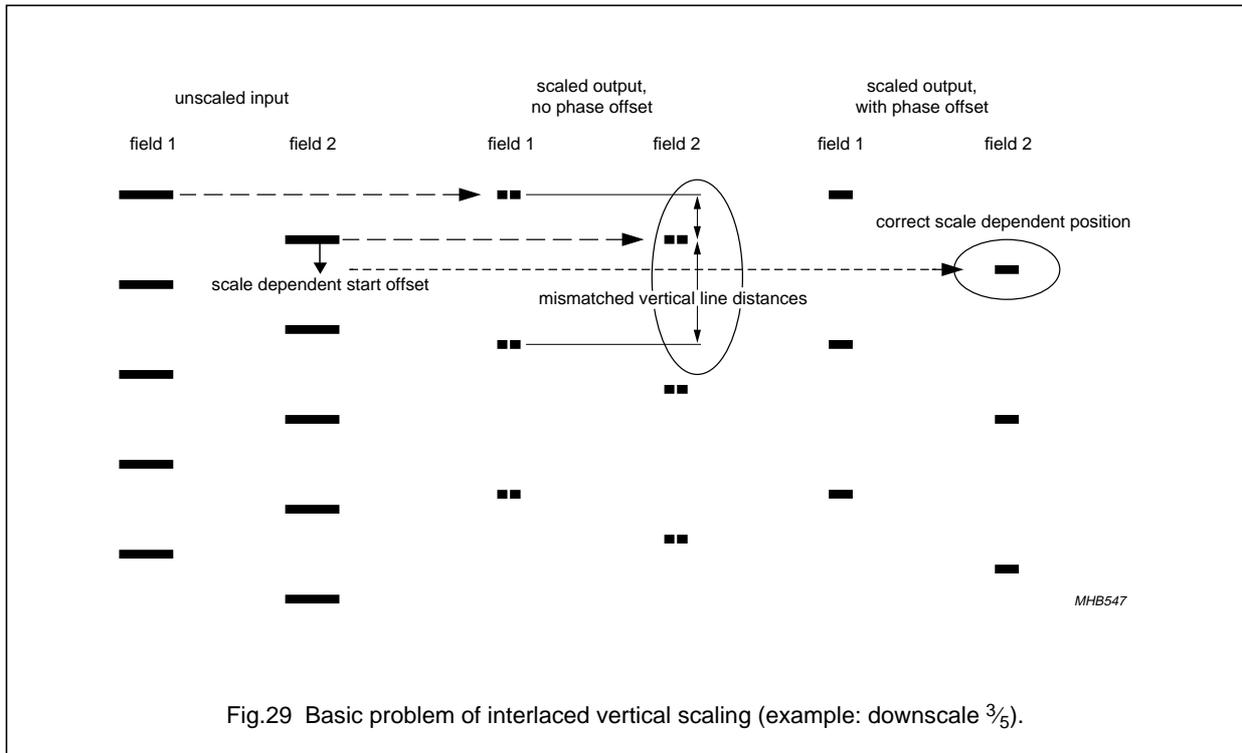

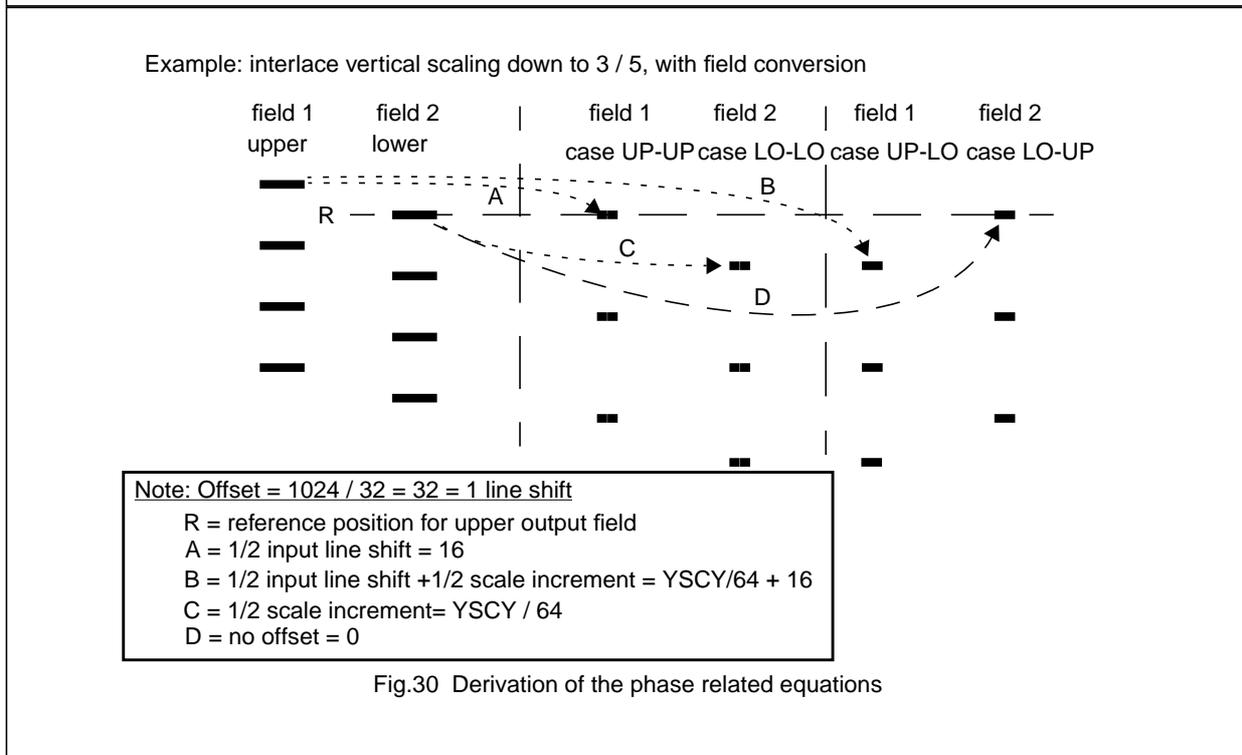

Fig.29 Basic problem of interlaced vertical scaling (example: downscale  $\frac{3}{5}$ ).

In Tables 15 and 16 PHO is a usable common phase offset.

It should be noted that the equations of Fig.30 produce an interpolated output, also for the unscaled case, as the geometrical reference position ( R ) for all conversions is the position of the first line of the lower field (see Table 15).

If there is no need for UP-LO and LO-UP conversion and the input field ID is the reference for the back-end operation, then it is UP-LO = UP-UP and LO-UP = LO-LO and the 1/2 line phase shift (PHO + 16) can be skipped.

This case is listed in Table 16.

The SAA7115 supports 4 phase offset registers per task and component (luminance and chrominance). The value of 20H represents a phase shift of one line.

The registers are assigned to the following events; e.g. subaddresses B8H to BBH:

- B8H: 00 = input field ID 0, task status bit 0 (toggle status, see Section 8.3.1.3)
- B9H: 01 = input field ID 0, task status bit 1
- BAH: 10 = input field ID 1, task status bit 0
- BBH: 11 = input field ID 1, task status bit 1.

Depending on the input signal (interlaced or non-interlaced) and the task processing 50 Hz or field reduced processing with one or two tasks (see examples in Section 8.3.1.3), other combinations may also be possible, but the basic equations are the same.

**Table 15** Examples for vertical phase offset usage: global equations (referring to reference position R)

| INPUT FIELD UNDER PROCESSING | OUTPUT FIELD INTERPRETATION | USED ABBREVIATION | EQUATION FOR PHASE OFFSET CALCULATION (DECIMAL VALUES) |
|------------------------------|-----------------------------|-------------------|--|
| Upper input lines            | upper output lines          | UP-UP             | PHO + 16   |
| Upper input lines            | lower output lines          | UP-LO             | $PHO + \frac{YSCY[15:0]}{64} + 16$                     |
| Lower input lines            | upper output lines          | LO-UP             | PHO  |
| Lower input lines            | lower output lines          | LO-LO             | $PHO + \frac{YSCY[15:0]}{64}$                          |

**Table 16** Vertical phase offset usage; assignment of the phase offsets for OFIDC[90[6]] = 0, scaler input field ID as output ID

| assumed backend interprets output field ID at "0" as upper output lines |                 |                       |                              |
|---|-----------------|-----------------------|------------------------------|
| detected input field ID   | task status bit | vertical phase offset | equation to be used (values) |
| 0 = upper lines   | 0               | YPY(C)0               | UP-UP (PHO)                  |
| 0 = upper lines   | 1               | YPY(C)1               | UP-UP (PHO)                  |
| 1 = lower lines   | 0               | YPY(C)2               | LO-LO (PHO + YSCY / 64 - 16) |
| 1 = lower lines   | 1               | YPY(C)3               | LO-LO (PHO + YSCY / 64 - 16) |

#### Notes

1. referring to the upper input field as reference position, a value of 16 is to be subtracted from the global equations of table 15.

**Table 17** Vertical phase offset usage: Assignment of the phase offsets for OFIDC[90[6]] = 1

| detected input field ID | task status bit | vertical phase offset | backend interprets output field ID "0" as upper lines; equation to be used | backend interprets output field ID "1" as upper lines; equation to be used |
|-------------------------|-----------------|-----------------------|--|--|
| 0 = upper lines         | 0               | YPY(C)0               | UP-UP  | UP-LO  |
| 0 = upper lines         | 1               | YPY(C)1               | UP-LO  | UP-UP  |
| 1 = lower lines         | 0               | YPY(C)2               | LO-UP  | LO-LO  |

#### 8.4 VBI-data decoder and capture (subaddresses 40H to 7FH)

The SAA7115 contains a versatile VBI-data decoder and the option of reading back sliced VBI data for low bitrate standards.

##### 8.4.1 VBI DATA SLICER

The circuitry recovers the actual clock phase during the clock run-in period, slices the data bits with the selected data rate, and groups them into bytes. The result is buffered into a dedicated VBI-data FIFO with a capacity of  $2 \times 56$  bytes ( $2 \times 14$  Dwords).

The VBI data slicing is controlled by the programming registers 40H to 5DH. Register 40H and 58H are controlling the slicing process itself. The Line Control Registers (LCR registers) 41H to 57H are defining the data type (VBI data standard) to be decoded. The data type is specified on a line by line basis for the lines two to 23 separately for even and odd field and depends additionally on the detected video standard (i.e. whether the incoming video is a 50Hz / 625 lines or 60Hz / 525 lines signal).

The definition for line control register LCR24 is valid for the rest of the corresponding field, normally no text data (video data) should be selected there (LCR24\_[7:0] = FFH) to stop the activity of the VBI-data slicer during active video. The supported VBI-data standards are shown in Table 18 for 60Hz / 525 lines signals and 19 for 50Hz / 625 lines signals.

**Table 18** 60Hz / 525 Lines VBI Data types supported by the data slicer block

| Data type |        | 60Hz / 525 Lines VBI Data Standards      |                     |                             |                     |               |  |

The adjustment of the slicer processing to the input signal source is defined by the programming registers 59h to 5BH. There are programmable offsets in the horizontal and vertical direction available: parameters HOFF[10:0] 5BH[2:0] 59H[7:0], VOFF[8:0] 5BH[4] 5AH[7:0], FOFF[5BH[7]] and VEP[5BH[5]].

Contrary to the scaler counting scheme, the slicer offsets define the position of the H and V trigger events related to the processed video field. The trigger events are the falling edge of HREF and the falling or rising edge of V123 (defined by VEP[5BH[5]]) from the decoder processing part.

**Note:**

The field ID, used for the slicers data packing, is taken at the internal pixel '1' and line '1' position. Hence for correct line counting according ITU656 and for 60 Hz input signals (see Fig.23), the old value of the field ID is taken as ID reference. This has effect on the I2C read back registers, on the LCR table, the LCR controlled field ID generation and the internal header information of the slicers output stream.

For consistent ID interpretation, the vertical offset parameter VOFF for NTSC has to be set to 0x03. For this case the LCR table covers the range from line 5 to 27 and line 21 corresponds to LCR18.

The relationship of these programming values to the input signal and the recommended values is outlined in table 7 to table 10.

The register SLDMOD[4:0] 5DH[4:0] defines the Slicer Data Output Mode at the I-Port of the SAA7115. This register enables the VBI output and defines the mode of data insertion into the I-port data stream.

Status Information can be read from register 5EH.

#### 8.4.2 I<sup>2</sup>C READBACK OF SLICED VBI DATA

The I<sup>2</sup>C Readback unit offers readback for the following VBI data standards via the I<sup>2</sup>C bus (subaddresses 66H 7FH):

- 60Hz / 525 lines VBI data standards
  - US Closed Caption (CC525):  
1 byte header + 2 x 2 bytes payload
  - Copy Generation Management System (CGMS, US Wide Screen Signalling (WSS525)):  
1 byte header + 2 x 3 bytes payload
  - Gemstar1x:  
1 byte header + 2 x 2 bytes payload
  - Gemstar2x:  
1 byte header + 2 x 4 bytes payload
- 50Hz / 625 lines VBI data standards
  - European Closed Caption (CC625):  
1 byte header + 2 x 2 bytes payload
  - European Wide Screen Signalling (WSS625, majority decoded and be-phase decoded):  
1 byte header + 2 x 2 bytes payload

For each VBI data standard the amount of data of one frame (one line per field) and a one byte header can be stored. The I<sup>2</sup>C Readback registers for Wide Screen Signalling and Closed Caption are shared for 60Hz / 525 lines VBI data standards and 50Hz / 625 lines VBI data standards. In case of decoding WSS625 this data is stored to the same registers than decoded WSS525 data with the third payload byte of each line left unconsidered.

The one byte header delivers decoding error status and the current update status separately for each field as well as a free running 4 bit field counter as reference information, to be able to detect multiple read data or loss of data (refer to table 20)

**Table 20** Structure of the I<sup>2</sup>C readback header

| BIT | HEADER DESCRIPTION   |
|-----|--|
| 7   | data of odd field (field_id = 0) is incomplete, i.e. not updated since last read, if set.                      |
| 6   | one or more data bytes of odd field (field_id = 0) are erroneous (data valid signal became inactive), if set.  |
| 5   | data of even field (field_id = 1) is incomplete. i.e. not updated since last read, if set.                     |
| 4   | one or more data bytes of even field (field_id = 1) are erroneous (data valid signal became inactive), if set. |
| 3:1 | field_count (counts up, field identifier represents the LSB)   |

The I<sup>2</sup>C Readback unit guarantees consistency between header information and sliced data using internal mirror-registers for the sliced data, which updated at the same time the header is accessed for reading via the I<sup>2</sup>C bus. I.e. The I<sup>2</sup>C Readback header must be always accessed before getting the latest data. In case the sliced data has been read already or is being updated at the time the header is accessed for reading, this will be signalled in the header bits 7 and 5 for each field separately.

Additionally to the read access to the header the data coming from VBI data slicer is copied into one of the mirror registers only, if the following additional conditions are satisfied:

- The data type as set in the LCR register must equal to the one of the sampled data.
- The data must be indicated as valid data.
- The maximum number of data bytes per line (CC, WSS625, Gemstar1x:2, CGMS:3, Gemstar2x: 4) is not exceeded

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

If there is less data in a line than expected for the appropriate data type, this is marked as an error inside the header. If there is more data in a line, this does not lead to an error, and the additional data bytes are neglected.

#### 8.4.3 SLICED VBI DATA OUTPUT AT THE I-PORT

The following sections are describing the sliced VBI payload data output at the I-Port. Chapter 8.5 describes the output modes for VBI data at the I-Port.

##### 8.4.3.1 Euro WST, US WST and NABTS Data

Euro WST, US WST and NABTS Data are stored in transmission order; first received bit becomes LSB of byte in payload.

##### 8.4.3.2 WSS 625 Data

Each payload byte contains a group of 6 bits (LSB aligned) representing a single symbol (a WSS625 bit) bi-phase coded and then oversampled at 3 times the baud rate. To decode the individual bits, it is usual to take a majority decision on each group of 3 bits (majority of 0s or 1s), then compare the first and second three-bit groups to do bi-phase decoding.

##### 8.4.3.3 WSS 525 Data

The received data contains 20 bits including 6 bits of CRC code; all 20 bits are packed into 3 bytes (LSB aligned in byte 3) and written to the packet with the first received bit becoming LSB of the first payload byte. CRC checking is performed on the received data (indicated in in the MSB of byte 3; set to '0' in case of no errors). Unused bytes are set to zero.

##### 8.4.3.4 VPS Data

Each pair of two consecutive bits in a payload data byte is a single symbol, biphase coded. 01 represents a 1 symbol, 10 represents a 0 symbol. 00 and 11 are biphase errors. The data can be decoded in minimum processor time by using a look-up table (256 bytes) using the received data as index, which gives the correct decoded biphase data in the 4 bits of each byte and 4 corresponding error flags; e.g.: a stored byte with hex value 0x1B (binary 00.01.10.11) would be decoded as 1001.0100 (i.e.: the middle two pairs 01 and 10 decode correctly to 1 and 0, but the outer two pairs 00 and 11 are errors).

##### 8.4.3.5 Closed Caption

Closed Caption is stored in transmission order - first received bit becomes LSB of the first payload byte.

##### 8.4.3.6 Moji Data

The Moji Data Line contains 272 bits, made up of a 14-bit prefix, 22 Information Data bytes (176 bits) and an 82-bit Parity Check. The captured bits are constructed into bytes, LSB first, in transmission order, but the first payload byte of the packet contains only 6 bits of trans-mitted data in bits 2 -7. Bit 2 corresponds to the first transmitted bit; bits 1 and 0 are filled with zeros.

This is done in order to align the Information Data bytes to byte boundaries in the constructed data packet. It also means that the last data byte in the packet contains only 2 transmitted bits (in positions 0 - 1) - the remaining 6 bits are undefined and should be ignored.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

#### 8.4.3.7 VITC Data

The VITC data line in both 625- and 525-line video formats contains 90 bits, which can be divided into nine 10-bit groups. The first two bits of each group are defined as Synchronising Bits, and consist of a fixed 1 followed by a fixed 0. These Synchronising Bits are **excluded** from the data packet constructed by the VBI Slicer, leaving exactly nine 8-bit bytes of useful data. The payload bytes are presented in transmission order, with the LSB of each corresponding to the first transmitted bit.

Note that this behaviour is different from the VBI Data Slicer of the predecessors of the SAA7115 that supported the VITC data types.

#### 8.4.3.8 Open Data Types

The Open data types are provided primarily to allow capture of low bitrate data types that are not specifically supported by the Data Capture Unit, by oversampling the transmitted data and leaving software to extract the individual bytes.

Acquisition starts when a match is found for the programmable framing code; bytes are then captured, LSB first, in transmission order at the specified bit-rate. The search window for the framing code is open between approximately 8 and 16ms into the line, referenced to the falling edge of the H-Sync pulse. The number of bytes captured in the open data types depends on when in this period the framing code match is found: the maximum numbers of bytes to be received are 38 Data Bytes for Open1 and 43 Bytes for Open2. They are the maximum assuming earliest possible detection of the framing code. If the framing code is detected any later, fewer bytes may be captured; also, data capture may extend into the region of the following line, in which case the last few data bytes in the packet will be meaningless. It is left up to the software to process the appropriate amount of data from the packet, as defined by the application for which the open data type is being used.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

### 8.5 Image port output interface (subaddresses 84H to 87H)

The output interface consists of a FIFO for video and for sliced text data, an arbitration circuit, which controls the mixed transfer of video and sliced text data over the I-port and a decoding and multiplexing unit, which generates the 8 or 16-bit wide output data stream and the accompanied reference and supporting information.

The clock for the output interface can be derived from an internal clock (decoder or X-port), from the second internal PLL set (PLL2 and CGC2) or an externally provided clock which is appropriate for e.g. VGA and frame buffer. The clock can be up to 33 MHz.

The scaler provides the following video related timing reference events (signals), which are available on pins as defined by subaddresses 84H and 85H:

- Output field ID
- Start and end of vertical active video range
- Start and end of active video line
- Data qualifier or gated clock
- Actually activated programming page (if CONLH is used)
- Threshold controlled FIFO filling flags (empty, full, filled)
- Sliced data marker.

The data stream at the scaler output is accompanied by a data valid flag (or data qualifier) or is transported using a gated clock. The discontinuous output data after the scaling process can be output as they occur or the data may be packed to continuous output lines by means of a trigger mechanism, which is controlled by a separate pulse generator (see addresses F5H to FBH).

Clock cycles with invalid data on the I-port data bus (including the HPD pins in 16-bit output mode) are handled in two different ways (controlled by INS80 86H[7]). As before, invalid cycles may be marked with 00H, but additionally a blanking value insertion (80H and 10H) as required by ITU656 is now implemented.

The output interface also arbitrates the transfer between scaled video data and sliced text data over the I-port output. The bits SLDOM (5DH) and VITX (86H) are used to control the arbitration.

As a further operation the serialization of the internal 32-bit Dwords to 8-bit or optional 16-bit output, as well as the insertion of the extended ITU 656 codes (SAV/EAV for video data, ANC or SAV/EAV codes for sliced text data) are done here.

For handshake with the VGA controller, or other memory or bus interface circuitry, programmable FIFO flags are provided (see Section 8.5.2).

### 8.5.1 SCALER OUTPUT FORMATTER (SUBADDRESSES 93H AND C3H)

The output formatter organizes the packing into the output FIFO. The following formats are available: Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2, Y-C<sub>B</sub>-C<sub>R</sub> 4 : 1 : 1, Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 0, Y-C<sub>B</sub>-C<sub>R</sub> 4 : 1 : 0, Y only (e.g. for raw samples). The formatting is controlled by FSI[2:0] 93H[2:0], FOI[1:0] 93H[4:3] and FYSK[93H[5]].

The data formats are defined on Dwords, or multiples, and are similar to the video formats as recommended for PCI multimedia applications, but planar formats are not supported.

FSI[2:0] defines the horizontal packing of the data, FOI[1:0] defines how many Y only lines are expected, before a Y/C line will be formatted. If FYSK is set to logic 0 preceding Y only lines will be skipped, and the output will always start with a Y/C line.

Additionally the output formatter limits the amplitude range of the video data (controlled by ILLV[85H[5]]); see Table 23.

**Table 21** Byte stream for different output formats

| OUTPUT FORMAT     | BYTE SEQUENCE FOR 8-BIT OUTPUT MODES |    |     |    |     |    |     |    |     |    |     |     |     |     |
|-------------------|--------------------------------------|----|-----|----|-----|----|-----|----|-----|----|-----|-----|-----|-----|
| Y-CB-CR 4 : 2 : 2 | CB0                                  | Y0 | CR0 | Y1 | CB2 | Y2 | CR2 | Y3 | CB4 | Y4 | CR4 | Y5  | CB6 | Y6  |
| Y-CB-CR 4 : 1 : 1 | CB0                                  | Y0 | CR0 | Y1 | CB4 | Y2 | CR4 | Y3 | Y4  | Y5 | Y6  | Y7  | CB8 | Y8  |
| Y only            | Y0                                   | Y1 | Y2  | Y3 | Y4  | Y5 | Y6  | Y7 | Y8  | Y9 | Y10 | Y11 | Y12 | Y13 |

**Table 22** Explanation to Table 21

| NAME | EXPLANATION   |
|------|---|
| CBn  | CB (B – Y) colour difference component, pixel number n = 0, 2, 4 to 718 |
| Yn   | Y (luminance) component, pixel number n = 0, 1, 2, 3 to 719             |
| CRn  | CR (R – Y) colour difference component, pixel number n = 0, 2, 4 to 718 |

**Table 23** Limiting range on I-port

| LIMIT STEP<br>ILLV[85H[5]] | VALID RANGE   |                   | SUPPRESSED CODES (HEXADECIMAL VALUE) |             |
|----------------------------|---------------|-------------------|--------------------------------------|-------------|
|                            | DECIMAL VALUE | HEXADECIMAL VALUE | LOWER RANGE                          | UPPER RANGE |
| 0                          | 1 to 254      | 01 to FE          | 00                                   | FF          |
| 1                          | 8 to 247      | 08 to F7          | 00 to 07                             | F8 to FF    |

### 8.5.2 VIDEO FIFO (SUBADDRESS 86H)

The video FIFO at the scaler output contains 32 Dwords. That corresponds to 64 pixels in 16-bit Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2 format. But as the entire scaler can act as a pipeline buffer, the actual available buffer capacity for the image port is much higher, and can exceed beyond a video line.

The video FIFO provides 4 internal flags, reporting to what extent the FIFO is actually filled.

These are:

- The FIFO Almost Empty (FAE) flag
- The FIFO Combined Flag (FCF) or FIFO filled, which is set at almost full level and reset, with hysteresis, only after the level crosses below the almost empty mark
- The FIFO Almost Full (FAF) flag
- The FIFO Overflow (FOVL) flag.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

The trigger levels for FAE and FAF are programmable by FFL[1:0] 86H[3:2] (16, 24, 28, full) and FEL[1:0] 86H[1:0] (16, 8, 4, empty).

The state of this flag can be seen on the pins IGP0 or IGP1. The pin mapping is defined by subaddresses 84H and 85H (see Section 9.5).

### 8.5.3 TEXT FIFO

The data of the internal VBI-data slicer is collected in the text FIFO before the transmission over the I-port is requested (normally before the video window starts). It is partitioned into two FIFO sections. A complete line is filled into the FIFO before a data transfer is requested. So normally, one line of text data is ready for transfer, while the next text line is collected. Thus sliced text data is delivered as a block of qualified data, without any qualification gaps in the byte stream of the I-port.

The decoded VBI-data is collected in the dedicated VBI-data FIFO. After capture of a line is completed, the FIFO can be streamed through the image port, preceded by a header, telling line number and standard.

The VBI-data period can be signalled via the sliced data flag on pin IGP0 or IGP1. The decoded VBI-data is lead by the ITU ancillary data header (SLDOM[4:0] 5DH[5:0] at value > 0H and <8H) or by SAV/EAV codes (SLDOM[4:0] 5DH[5:0] at value > 0H and bit D3 = 1 ). Similar to the global data qualifier on pin IDQ, the sliced data flag frames the transfer of sliced VBI data from the first to the last byte and can be taken to distinguish video from sliced VBI data.

The decoded VBI-data are presented in two different data formats, controlled by bit D0 of SLDOM[4:0].

- SLDOM[0] = 1: values 00H and FFH will be recoded to even parity values 03H and FCH
- SLDOM[0] = 0: values 00H and FFH may occur in the data stream as detected.

### 8.5.4 VIDEO / TEXT ARBITRATION AND DATA PACKING (SUBADDRESS 86H)

Sliced text data and scaled video data are transferred over the same bus, the I-port. The mixed transfer is controlled by an arbitration circuit and the SLDOM programming.

If the video data are output for the whole field (also during vertical blanking) and the video FIFO does not need to buffer any output pixel, the text data is inserted after the end of a scaled video line, normally during the horizontal blanking interval of the video.

#### 8.5.4.1 VBI insertion in SAV/EAV mode (bit SLDOM[3] = '1')

VBI insertion in SAV/EAV mode (bit SLDOM[3] = '1'):

Especially for external devices, which do not recognize the ANC framing of the sliced VBI data and which need to use the SAV/EAV framing, there are now different levels of VBI/video data insertion implemented.

This functionality is controlled by SLDOM [5DH].

Levels of sliced data insertion:

1. SLDOM[4] = 0: video and sliced data, according SLDOM[1], in parallel, VBI data after EAV sequence of a video line
2. SLDOM[4] = 1: sliced data, according SLDOM[1], video output is skipped for these lines

Note:

- 1.the insertion after EAV and the skipping is only done, if the scaler region overlaps with the LCR defined VBI region.

#### 8.5.4.2 Data Packing (bit IMPAK (86H) and programming of the pulse generator via addr. F5H to FBH)

To make use of the synthesized line locked PLL2 clock and to enable the use of the scaler for a wider application range, it is now possible to retain the output data of the scaler, until a scaled line can be output as a continuous data package. This is done via internal trigger pulses, one for each type of scaler output data (video from page A or B or sliced VBI data). The parameters PGHAPS (video page A), PGHBPS (video page B) and PGHCPS (sliced VBI data) are defining the delay related to the rising edge of the decoders HREF or of the synthesized HREF (generated by the internal pulse generator, see addr. F5H and F6H). The delay is counted in clock cycles and as a rough estimate for the internal buffering level you can take the following equation for the video data streaming.

With

num\_buf\_pix = number of buffered pixel,

num\_buf\_lifo = number of pixel buffered in the internal line FIFO

num\_buf\_fifo = number of pixel buffered in the output FIFO

h\_blanking = number of clock cycles during horizontal blanking = 288 (PAL), 276 (NTSC)

sc\_run\_in = number of clock cycles for scaler running in = about 72 clock cycles for unscaled video

$$\text{num\_buf\_pix is about } \approx (\text{PGHAPS} - \text{h\_blanking} - \text{sc\_run\_in}) / 2 = \text{num\_buf\_lifo} + \text{num\_buf\_fifo}$$

Where

num\_buf\_lifo = 0 for num\_buf\_pix <= 64 and the maximum value of num\_buf\_lifo = 768dec

num\_buf\_fifo = 64 for num\_buf\_pix > 64

For unscaled video a level around 1/2 of the buffer capacity (num\_buf\_lifo + num\_buf\_fifo = 832dec) is recommended. This leads to a PGHAPS value of about  $\approx 2 \times 416 + \text{h\_blanking} + \text{sc\_run\_in} = 1192$  (PAL case) for the unscaled case.

To be able to align the EAV sequences for different scales and regions, PGHBPS of page B is a separate parameter. The number of bytes per line and region defines, whether PGHBPS is to be programmed differently to PGHAPS.

If all data types are to be mixed and a fixed SAV/EAV pattern is needed, the VBI slicer has to become the timing master for the data packing. To avoid timing shifts in the EAV pattern, the latest point of text line completion defines the earliest packing timing. This is about 48 clocks before rising edge of the decoders HREF. The slicer data need to be shifted to a position later than this point. The latest point in time is defined by the internal video skipping procedure (SLDOM[4] = '1'). Therefore the end of a video line (EAV) need to have a distance of (number of pixels per line) of clock cycles from the mentioned point of text line completion.

Considering the PLL behaviour and for correct video skipping, the recommendation for this situation and EAV alignment for 720 pixel per line and PAL (=1728) is:

$$1728 - (48+56) - 720 - 1448 = -544 \geq 1184 \geq \text{PGHCPS} \geq 1728 - (48-20) = 1700$$

$$\text{PGHAPS} = \text{PGHCPS} - \text{num\_bytes\_per\_video\_line} + \text{num\_bytes\_per\_VBI\_package} = \text{e.g. } 1700 - 1448 + 56 = 308\text{dec}$$

For other clock rates than 27 MHz, the mentioned values need to be scaled according to the clock relations, e.g. 24.545454 MHz would give

$$1560 - 94 - 640 - 1288 = -462 \geq 1098 \geq \text{PGHCPS} \geq 1560 - 25 = 1535$$

$$\text{PGHAPS} = \text{e.g. } 500 - 1288 + 51 = -737 = 823\text{dec}$$

#### 8.5.5 DATA STREAM CODING AND REFERENCE SIGNAL GENERATION (SUBADDRESSES 84H, 85H AND 93H)

As H and V reference signals are logic 1, active gate signals are generated, which frame the transfer of the valid output data. As an alternative to the gates, H and V trigger pulses are generated on the rising edges of the gates.

Due to the dynamic FIFO behaviour of the complete scaler path, the output signal timing has no fixed timing relationship to the real-time input video stream. So fixed propagation delays, in terms of clock cycles, related to the analog input cannot be defined.

The data stream is accompanied by a data qualifier. ITU 656 like codes need to be activated by means of the bit ICODE set to '1'.

The behaviour during non qualified clock cycles is defined by the bit INS80 [93H[6]].

With INS80 = '0' the interface behaves like SAA7118/7114 and invalid data cycles are marked with code 00H.

For  $INS80 = '1'$  the behaviour changes and inside the scalers output line (scaler H-gate on  $IGPH = '1'$ ), the data are hold during  $IDQ = '0'$ . Outside the scalers output, in the remaining horizontal blanking interval, blanking values are inserted.

As a further option, it is possible to provide the scaler with an external gating signal on pin  $ITRDY$ . Thereby making it possible to hold the data output for a certain time and to get valid output data in bursts of a guaranteed length.

The sketched reference signals and events can be mapped to the I-port output pins  $IDQ$ ,  $IGPH$ ,  $IGPV$ ,  $IGP0$  and  $IGP1$ . For flexible use the polarities of all the outputs can be modified. The default polarity for the qualifier and reference signals is logic 1 (active).

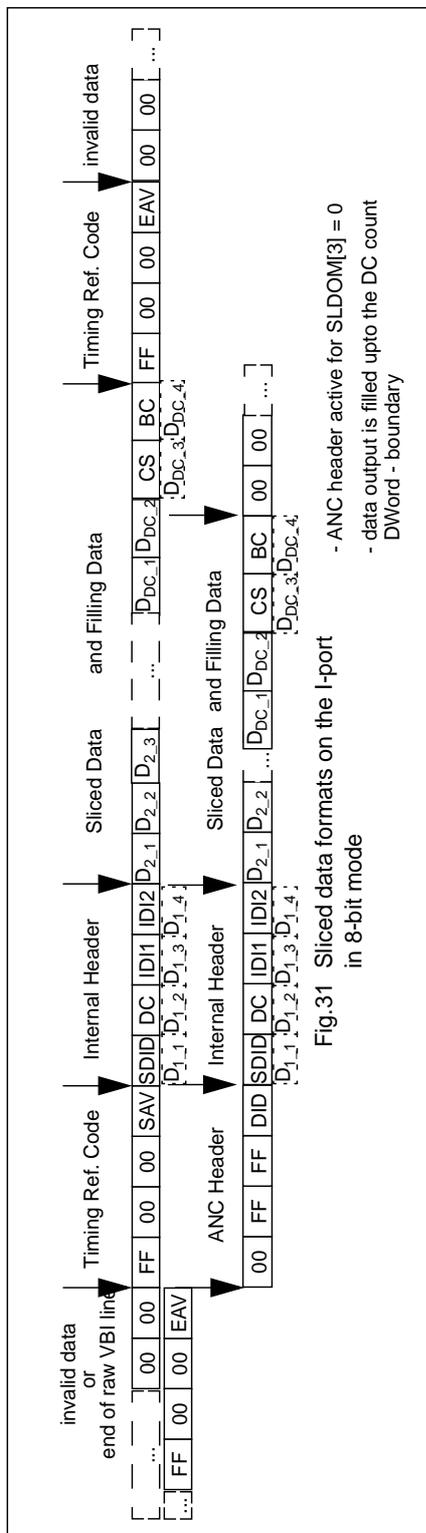

Table 24 shows the relevant and supported SAV and EAV coding, the figures 34, 33, 35, 36 show some basic pulse diagrams.

**Table 24** SAV/EAV codes on I-port

| EVENT DESCRIPTION   | SAVE/EAV CODES ON I-PORT <sup>(1)</sup> (HEX) |              |   |              | COMMENT                             |

| No valid data, don't capture and don't increment pointer                        | 00 (only for $INS80 = '0'$ )                  |              |   |              | IDQ pin inactive                    |

**Notes**

- The leading byte sequence is: FFH-00H-00H.
- The MSB of the SAV/EAV code byte is controlled by:
  - Scaler output data: task A  $\Rightarrow$   $MSB = \overline{CONLH}[90H[7]]$ ; task B  $\Rightarrow$   $MSB = \overline{CONLH}[C0H[7]]$ .
  - VBI-data slicer output data:  $SLDOM[2] = '1' \Rightarrow MSB = 1$ ;  $SLDOM[2] = '0' \Rightarrow MSB = 0$ .

**Table 25** Explanation to Fig.31

| NAME  | EXPLANATION  |
|-------|--|
| SAV   | start of active data; see Table 26   |
| SDID  | sliced data identification: NEP <sup>(1)</sup> , EP <sup>(2)</sup> , SDID5 to SDID0, freely programmable via I2C-bus subaddress 5EH, D5 to D0, e. g. to be used as source identifier   |
| DC    | Dword count: NEP <sup>(1)</sup> , EP <sup>(2)</sup> , DC5 to DC0. DC describes the number of succeeding 32-bit words: <ul style="list-style-type: none"> <li>• For SAV/EAV mode DC is fixed to 12 Dwords (byte value 8CH)</li> <li>• For ANC mode the data count DC can be taken from table 27.</li> </ul> The count starts with the SDID byte and ends with BC<br>It should be noted that the number of valid bytes inside the stream can be seen in the BC byte. |
| IDI1  | internal data identification 1: OP <sup>(3)</sup> , FID (field 1 = 0, field 2 = 1), LineNumber8 to LineNumber3 = Dword 1 byte 1; see Table 26  |
| IDI2  | internal data identification 2: OP <sup>(3)</sup> , LineNumber2 to LineNumber0, DataType3 to DataType0 = Dword 1 byte 2; see Table 26  |
| Dn_m  | Dword number n, byte number m  |
| DDC_4 | last Dword byte 4, note: for SAV/EAV framing DC is fixed to 0BH, missing data bytes are filled up; the fill value is A0H   |
| CS    | the check sum byte, the check sum is accumulated from the SAV (respectively DID) byte to the DDC_4 byte  |
| BC    | number of valid sliced bytes counted from the D1_3 byte  |
| EAV   | end of active data; see Table 26   |

**Notes**

1. Inverted EP (bit 7); for EP see note 2.
2. Even parity (bit 6) of bits 5 to 0.
3. Odd parity (bit 7) of bits 6 to 0.

**Notes**

1. NEP = inverted EP (see note 2).
2. EP = Even Parity of bits 5 to 0.
3. FID = 0: field 1; FID = 1: field 2.
4. I1 = 0 and I0 = 0: before line 1; I1 = 0 and I0 = 1: lines 1 to 23; I1 = 1 and I0 = 0: after line 23; I1 = 1 and I0 = 1: line 24 to end of field.
5. Subaddress 5DH at 3EH and 3FH are used for ITU 656 like SAV/EAV header generation; recommended value.
6. V = 0: active video; V = 1: blanking.
7. H = 0: start of line; H = 1: end of line.
8. DC = Data Count in Dwords according to the data type.
9. OP = Odd Parity of bits 6 to 0.
10. LN = Line Number.
11. DT = Data Type according to table.

**Table 27** Data count (DC) in ANC mode for the various VBI standards

**Notes**

1. 'nop' = no data output

### 8.6 Scaler Backend clock generation (subaddresses 30H to 3FH)

The SAA7115 incorporates with its Audio clock PLL (APLL), its second digital PLL (PLL2) and its second analog PLL (CGC2) the generation of multiple different clocks for internal and external usage. The following types of clocks can be generated:

- A Backend Clock to drive the Scaler backend including Image Port data output (refer to chapter 8.6.1):  
This is an internal clock which is used for the output of data at the image port (I-Port). It can be defined as a square pixel clock for PAL and NTSC (29,5 MHz and 24,5454 MHz respectively).
- A frame locked Audio Master clock (output at device pin 37, AMCLK; refer to chapter 8.7):  
This clock, which is locked to the frame frequency, ensures that there is always the same predefined number of audio samples associated with a frame. This ensures e.g. synchronous recording of audio and video (e.g. capture to hard disk, or non-linear editing).

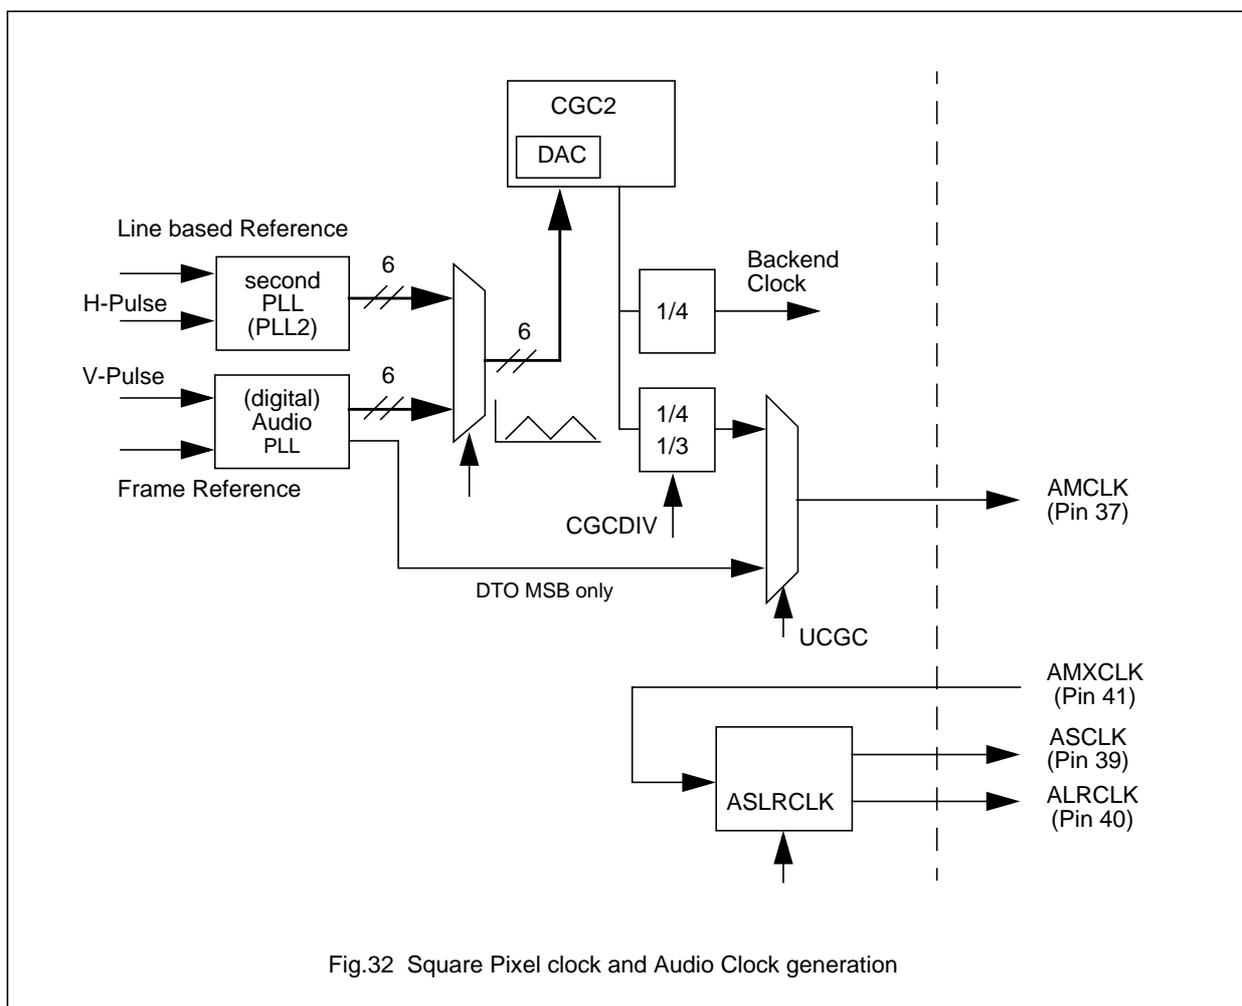

Fig.32 Square Pixel clock and Audio Clock generation

### 8.6.1 SQUARE PIXEL CLOCK GENERATION

The SAA7115 is capable to output video data especially in Square Pixel formats. i.e.:

- PAL video line (625 lines per frame) is output with 768/176 continuous active/inactive video pixel at 29.5 MHz clock frequency
- NTSC Video line(525 lines per frame) is output with 640/140 continuous active/inactive video pixel at 24.54 MHz clock frequency.

To generate the clock which allows a continuous data stream at the image port the SAA7115 has implemented the second analog PLL (CGC2) which is stimulated by the line locked second digital PLL (PLL2, alias "Square Pixel" PLL). The CGC2 output clock drives the Scaler Backend and the Pulse Generator to deliver video data with Square Pixel format at the I-Port. To avoid Scaler FIFO overflows/underruns the pixel clock must be phase aligned to the video input signal. Hence the reference of the second digital PLL (PLL2) is a horizontal reference signal obtained from the combfilter decoder or the X-Port input XRH (controlled by SPHSEL, register address F1 H [D1]).

Only the square pixel clock frequencies of 29.5 MHz and 24.5454 MHz are targeted for driving the scaler backend with PLL2 / CGC2.

#### 8.6.1.1 The second PLL (PLL2)

The second PLL (PLL2) consists of a discrete time oscillator (DTO), a phase detector which computes the phase error once per video line while taking into account the current DTO phase and a PI -Loop Filter with programmable P/I coefficients.

If the phase error become less then a programmed locking threshold value SPTHRM [3:0] (register address FF H [3:0]) for a period of time defined number of lines programmed in SPTHRL [3:0] register (register address FF H [7:4]), the PLL2 indicates the status locked. If the PLL is locked, a status register SPLOCK (register address F1H [0]) is set.

The PLL2 is controlled by the following settings:

- Number of target clock cycles per line divided by 4 (SPLPL, register addresses F1 h [D0], F0 H [D7:D0])
- Nominal DTO increment (SPNINC, register addresses F3 H [D7:D0], F2 H [D7:D0]):  
The nominal Increment is basic clock frequency setting for PLL2 and hence for CGC2 clock output (CGC2frequency, in scaler backend clock generation mode). If PLL2 is opened it is the only parameter which defines the defines the clock frequency. It depends on the crystal frequency (32.11 MHz or 24.576 MHz) and is calculated as:

$$SPNINC = \text{integer}\left(\left(\frac{CGC2frequency}{4 \cdot XTALfrequency}\right) \cdot 2^{16}\right)$$

- PLL2 operation mode (SPMOD, register address F1 H [D3:D2]):
  - PLL-closed (normal operation mode, SPMOD = 01 bin):  
This is the normal operation mode of the second PLL (PLL2): the nominal increment plus the content of loop filter define the output (CGC2) frequency.
  - Synthesize Clock Mode (SPMOD = 00 bin):  
The PLL2 is opened and hence the generated clock frequency at CGC2 output depends only on the nominal increment defined by the register SPNINC. The contribution of the loop filter is disabled. The I and P proportion of the loop filter is set to zero.
  - PLL-hold (SPMOD = 10 bin):  
The CGC2 output keeps the same clock frequency which was generated when entering this mode. In this mode content of the loop filter of PLL2 will be frozen.
  - PLL-Re-Sync (SPMOD = 11 bin)  
The phase detector of PLL2 is continuously re-synchronized to the selected horizontal reference signal controlled by SPHSEL. The remaining phase error is fed into the loop filter.
- Loop Filter Mode (P/I parameter selection; SPPI, register address F1 H [D7:D4]):  
As long as the PLL2 is in un-locked state the Loop Filter operates at a fast time constant to enable fast locking to the

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

input signal. As soon as the status is locked the PI-filter is controlled by the SPPI setting. Four different modes can be selected controlled via SPPI:

- Mode 0 H (default); Adaptive mode:  
The proportional part is controlled dynamically by the magnitude of the phase error.
- Mode 1 H; Fast mode  
Both P and I parameters of the Loop Filter remain on the “unlocked” values, even if PLL2 has locked.
- Mode E H; Medium mode:  
The proportional part (P) of the Loop Filter is set to a medium value and the integral part (I) is set to minimum.
- Mode F H; Slow mode:  
Both the proportional part and the integral part are set to minimum value.

## 8.7 Audio clock generation (subaddresses 30H to 3FH)

The SAA7115 incorporates with its Audio clock PLL (APLL), its second analog PLL (CGC2) the generation of multiple different audio clocks for external usage. There are two basic modes for generating an audio clock (refer to figure 32):

- Generating a frame locked Audio Master clock without using the second analog PLL (CGC2) (refer to chapter 8.7.1):  
This frame locked audio clock is directly obtained from the digital Audio PLL and output at the device pin AMCLK (pin 37). Hence this signal carries the correct number of clock cycles per frame but still has a high frequency jitter. This clock can be fed to an external PLL and then returned to the AMXCLK pin (pin 41) to generate an serial bitclock - output at the ASCLK pin (pin 39) - and a word select signal - output at the ALRCLK pin (pin 40).  
Using this audio clock generation method audio clock frequencies it is not possible to generate frequencies of  $384 \cdot f_s$  and  $512 \cdot f_s$  ( $f_s$  = audio sampling frequency)
- Generating a low jitter frame locked Audio Master clock supported by the second analog PLL (CGC2) (refer to chapter 8.7.2):  
In this mode the digital Audio PLL output signal feeds the internal second analog PLL (CGC2) to remove high frequency jitter from the audio clock signal. The resulting clock is output at the device pin AMCLK (pin 37).  
This is already the audio clock for some high frequency audio clocks. All other audio clocks must be generated by feeding back the AMCLK output signal into the AMXCLK input pin. The audio clock frequency will be defined by the programming value of the SDIV[5:0] register (subaddress 38hex) and output at the ASCLK output pin (pin 39).

Both modes ensure that there is always the same predefined number of audio samples associated with a frame, because the audio clock is locked to the frame frequency.

### 8.7.1 AUDIO CLOCK GENERATION WITHOUT ANALOG PLL (CGC2) ENHANCEMENT

#### 8.7.1.1 Master audio clock

The audio clock is synthesized from the same crystal frequency as the line-locked video clock is generated. The master audio clock is defined by the parameters:

- Audio master Clocks Per Field, ACPF[17:0] 32H[1:0] 31H[7:0] 30H[7:0] according to the equation:

$$ACPF[17:0] = \text{round}\left(\frac{\text{audio master clock frequency}}{\text{field frequency}}\right)$$

- Audio master Clocks Nominal Increment, ACNI[21:0] 36H[5:0] 35H[7:0] 34H[7:0] according to the equation:

$$ACNI[21:0] = \text{round}\left(\frac{\text{audio master clock frequency}}{\text{crystal frequency}} \times 2^{23}\right)$$

See Table 28 for examples.

**Remark:** For standard applications the synthesized audio clock AMCLK can be used directly as master clock and as input clock for port AMXCLK (short cut) to generate ASCLK and ALRCLK. For high-end applications it is recommended to either use the second CGC for audio clock generation by setting UCGC = 1 (see subaddress 3AH, bit 7) or use an external analog PLL circuit to enhance the performance of the generated audio clock.

**Table 28** Programming examples for audio master clock generation (no CGC2 support)

| XTALO<br>(MHz)                       | FIELD<br>(Hz) | ACPF    |       | ACNI    |        |

|                                      | 59.94         | 136670  | 215DE | 2796203 | 2AAAAB |

### 8.7.1.2 Signals ASCLK and ALRCLK

Two binary divided signals ASCLK and ALRCLK are provided for slower serial digital audio signal transmission and for channel-select. The frequencies of these signals are defined by the following parameters:

- SDIV[5:0] 38H[5:0] according to the equation:

$$f_{ASCLK} = \frac{f_{AMXCLK}}{(SDIV + 1) \times 2} \Rightarrow SDIV[5:0] = \frac{f_{AMXCLK}}{2f_{ASCLK}} - 1$$

- LRDIV[5:0] 39H[5:0] according to the equation:

$$f_{ALRCLK} = \frac{f_{ASCLK}}{LRDIV \times 2} \Rightarrow LRDIV[5:0] = \frac{f_{ASCLK}}{2f_{ALRCLK}}$$

See Table 29 for examples.

**Table 29** Programming examples for ASCLK/ALRCLK clock generation

| AMXCLK<br>(MHz) | ASCLK<br>(kHz) | SDIV    |     | ALRCLK<br>(kHz) | LRDIV   |     |
|-----------------|----------------|---------|-----|-----------------|---------|-----|

### 8.7.2 AUDIO CLOCK GENERATION WITH ANALOG PLL (CGC2) SUPPORT

When generating the Audio clock using the second analog PLL (CGC2) the CGC2 is driven by the digital Audio Clock PLL. The Output of CGC2 again is output at the audio master clock output pin AMCLK (pin 37) controlled by the UCGC (address 3A H [7]) programming register. For audio clock frequencies of  $512 \cdot f_s$ , with  $f_s = 48.0$  KHz or  $44.1$  KHz this is already the low jitter audio clock. All other low jitter audio clocks are output at the ASCLK pin (pin 39) using the internal divider controlled by SDIV (address 38 H [5:0]) programming register (refer to table 30 and 31). Therefore the audio master clock AMCLK must be returned into the device via the AMXCLK pin (pin 41).

The audio master clock again is synthesized from the same crystal frequency as the line-locked video clock and is defined as:

- Audio master Clocks Per Field, ACPF[17:0] 32H[1:0] 31H[7:0] 30H[7:0] according to the equation:

$$ACPF[17:0] = \text{round}\left(\left(\frac{\text{audio master clock frequency}}{\text{field frequency}}\right) \cdot \left(\frac{(4 - CGCDIV)}{16}\right)\right)$$

- Audio master Clocks Nominal Increment, ACNI[21:0] 36H[5:0] 35H[7:0] 34H[7:0] according to the equation:

$$ACNI[21:0] = \text{round}\left(\left(\frac{\text{audio master clock frequency}}{\text{crystal frequency}} \times 2^{23}\right) \cdot \left(\frac{(4 - CGCDIV)}{16}\right)\right)$$

Note that in this case the audio master clock is not identical to the clock output by the digital audio clock PLL any more.

The second analog PLL (CGC2) operates at a centre frequency of 36 MHz if CGCDIV (register address 3A H [6]) is set to 1 and 27 MHz if CGCDIV is set to 0. CGC2 can operate in a range of -18% and +15.8% around these centre frequencies.

**Table 30** Programming examples for frame locked audio clock generation supported by CGC2, fxtal = 24.576 MHz, 625 /525 line systems

### 8.7.3 OTHER CONTROL SIGNALS FOR AUDIO CLOCK GENERATION

Further control signals are available to define reference clock edges and vertical references:

APLL[3AH[3]]; Audio PLL mode:

0: PLL closed

1: PLL open

AMVR[3AH[2]]; Audio Master clock Vertical Reference:

0: internal V

1: external V

LRPH[3AH[1]]; ALRCLK Phase

0: invert ASCLK, ALRCLK edges triggered by falling edge of ASCLK

1: don't invert ASCLK, ALRCLK edges triggered by rising edge of ASCLK

SCPH[3AH[0]]; ASCLK Phase:

0: invert AMXCLK, ASCLK edges triggered by falling edge of AMXCLK

1: don't invert AMXCLK, ASCLK edges triggered by rising edge of AMXCLK.

## 9 INPUT/OUTPUT INTERFACES AND PORTS

The SAA7115 has 5 different I/O interfaces:

- Analog video input interface, for analog CVBS and/or Y and C input signals
- Audio clock port
- Digital real-time signal port (RT port)
- Digital video expansion port (X-port), for unscaled digital video input and output
- Digital image port (I-port) for scaled video data output and programming
- Digital host port (H-port) for extension of the image port (output mode) or expansion port (input mode) from 8 to 16-bit.

### 9.1 Analog terminals

The SAA7115 has 6 analog inputs AI21 to AI24 and AI11 to AI12 for composite video CVBS or S-video Y/C signal pairs.

Additionally, there are two differential reference inputs, which must be connected to ground via a capacitor equivalent to the decoupling capacitors at the 6 inputs. Per connected input there are no peripheral components required other than a decoupling capacitor of 47nF directly connected to the analog device inputs pins), an 18  $\Omega$  (connected in series directly to the source) and 56  $\Omega$  (connected between the capacitor and the 18  $\Omega$  resistor to ground) termination resistor. Two anti-alias filters are integrated.

Clamp and gain control for the ADCs are also integrated. An analog video output (pin AOUT) is provided for testing purposes.

**Table 32** Analog pin description

| SYMBOL                    | PIN            | I/O | DESCRIPTION   | BIT                               |
|---------------------------|----------------|-----|---|-----------------------------------|
| AI11 and AI12             | 20, 18         | I   | analog video signal inputs, e.g. six CVBS signals or two Y/C plus two CVBS pairs signal groups can be connected simultaneously to this device; several combinations are possible; see table 54. | MODE3 to MODE0 (02H[3:0])         |
| AI21, AI22, AI23 and AI24 | 16, 14, 12, 10 |     |   |                                   |
| AOUT                      | 22             | O   | analog video output, for test purposes  | AOSL2 to AOSL0 (01H[7], 14H[5:4]) |
| AI1D, AI2D                | 19, 13         | I   | analog reference pins for differential ADC operation; connect to ground via 47 nF   | –                                 |

### 9.2 Audio clock signals

The SAA7115 also synchronizes the audio clock and sampling rate to the video frame rate, via a very slow PLL. This ensures that the multimedia capture and compression processes always gather the same predefined number of samples per video frame.

There are two basic modes as described in chapter 8.7 . Depending on these modes the signals AMCLK, ASCLK and ALRCLK are generated (Note: To generate ASCLK and ALRCLK the Audio Master clock AMCLK must be fed back into the device via the AMXCLK pin.).

- Generating a frame locked Audio Master clock without using the second analog PLL (CGC2):
  - AMCLK: is the audio clock.
  - ASCLK: can be used as audio serial clock.
  - ALRCLK: audio left/right channel clock.
- Generating a low jitter frame locked Audio Master clock supported by the second analog PLL (CGC2):
  - AMCLK: is the audio clock for 512\*fs (fs = 48KHz or 44.1KHz).

– ASCLK: is the audio clock for all other audio clock frequencies.

The ratios are programmable; see also chapter 8.7.

**Table 33** Audio clock pin description

| SYMBOL | PIN | I/O | DESCRIPTION   | BIT   |
|--------|-----|-----|---|---|
| AMCLK  | 37  | O   | Audio master clock output without use of CGC2   | ACPF[17:0] (32H[1:0] 31H[7:0] 30H[7:0]),<br>ACNI[21:0] (36H[5:0] 35H[7:0] 34H[7:0]),<br>AMVR (3AH[2]),<br>APLL (3AH[3]),<br>UCGC (3AH[3]; must be set to 0)                     |
|        |     |     | Audio master clock output using of CGC2 (low jitter audio clock)  | ACPF[17:0] (32H[1:0] 31H[7:0] 30H[7:0]),<br>ACNI[21:0] (36H[5:0] 35H[7:0] 34H[7:0]),<br>AMVR (3AH[2]),<br>APLL (3AH[3]),<br>UCGC (3AH[3]; must be set to 1),<br>CGCDIV (3AH[6]) |
| AMXCLK | 41  | I   | External audio master clock input for the clock division circuit, can be directly connected to output AMCLK for standard applications | –   |
| ASCLK  | 39  | O   | Serial audio clock output, can be synchronized to rising or falling edge of AMXCLK  | SDIV[5:0] (38H[5:0]),<br>SCPH (3AH[0]),   |
| ALRCLK | 40  | O   | Audio channel (left/right) clock output, can be synchronized to rising or falling edge of ASCLK.                                      | LRDIV[5:0] (39H[5:0]),<br>LRPH(3AH[1])  |
|        |     | I   | Strapping during reset determines the crystal oscillator frequency to be used.  | -   |

### 9.3 Clock and real-time synchronization signals

For the generation of the line-locked video (pixel) clock LLC, and of the frame-locked audio serial bit clock, a crystal accurate frequency reference is required. An oscillator is built-in for fundamental or third harmonic crystals. The supported crystal frequencies are 32.11 MHz and 24.576 MHz (defined during reset by strapping pin ALRCLK).

Alternatively pin XTALI can be driven from an external single-ended oscillator.

The crystal oscillation can be propagated as a clock to other ICs in the system via pin XTOUT.

The Line-Locked Clock (LLC) is the double pixel clock of nominal 27 MHz. It is locked to the selected video input, generating baseband video pixels according to "ITU recommendation 601". In order to support interfacing circuits, a direct pixel clock (LLC2) is also provided.

The pins for line and field timing reference signals are RTCO, RTS1 and RTS0. Various real-time status information can be selected for the RTS pins. The signals are always available (output) and reflect the synchronization operation of the decoder part in the SAA7115. The function of the RTS1 and RTS0 pins can be defined by bits RTSE1[3:0] 12H[7:4] and RTSE0[3:0] 12H[3:0].

**Table 34** Clock and real-time synchronization signals

| SYMBOL                      | PIN | I/O | DESCRIPTION   | BIT                      |
|-----------------------------|-----|-----|---|--------------------------|
| Crystal oscillator          |     |     |   |                          |
| XTALI                       | 7   | I   | input for crystal oscillator or reference clock   | –                        |
| XTALO                       | 6   | O   | output of crystal oscillator  | –                        |
| XTOUT                       | 4   | O   | reference (crystal) clock output drive (optional)   | XTOUTE (14H[3])          |
| Real-time signals (RT port) |     |     |   |                          |
| LLC                         | 28  | O   | line-locked clock, nominal 27 MHz, double pixel clock locked to the selected video input signal, for backward compatibility only, do not use for new applications | –                        |
| LLC2                        | 29  | O   | line-locked pixel clock, nominal 13.5 MHz, for backward compatibility only, do not use for new applications   | –                        |
| RTCO                        | 36  | O   | real-time control output, transfers real-time status information supporting RTC level 3.1 (see document “RTC Functional Description”, available on request)       | –                        |
|                             |     | I   | Strapping during reset determines the I <sup>2</sup> C read/write addresses address.  | –                        |
| RTS0                        | 34  | O   | real-time status information line 0, can be programmed to carry various real-time information (see Table 70)  | RTSE0[3:0]<br>(12H[3:0]) |
| RTS1                        | 35  | O   | real-time status information line 1, can be programmed to carry various real-time information (see Table 71)  | RTSE1[3:0]<br>(12H[7:4]) |

#### 9.4 Video expansion port (X-port)

The expansion port can be used either to output eight or ten bit video from the combfilter decoder directly or to receive video data from other external digital video sources such as MPEG decoder for output at the image port (I-port) whilst.

The expansion port consists of three main groupings of signals:

- 8-bit dithered or 10-bit data output of component video Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2, i.e. in C<sub>B</sub>-Y-C<sub>R</sub>-Y, sequence. In 10-bit wide video mode the two data LSB's are output on the XRH and XRV signal lines.  
Exceptionally raw video samples (e.g. ADC test).
- 8-bit data input of component video Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2, i.e. C<sub>B</sub>-Y-C<sub>R</sub>-Y, byte serial. In input mode optionally the data bus can be extended to 16-bit by pins HPD7 to HPD0. In this mode XPD [7:0] carries the luminance data and HPD [7:0] carries the Chrominance data.
- Clock, synchronization and auxiliary I/O signals, accompanying the data stream.

The data transfers through the expansion port represent a single D1 port, with half duplex mode. The SAV and EAV codes may be inserted optionally for data input (controlled by bit XCODE (92H[3])). The input/output direction is switched for complete fields only.

**Table 35** Signals dedicated to the expansion port

| SYMBOL       | PIN                    | I/O   | DESCRIPTION  | BIT   |
|--------------|------------------------|-------|--|---|
| XPD7 to XPD0 | 81, 82, 84 -87, 89, 90 | I/O   | X-port data:<br>in output mode controlled by decoder section, data format see Table 36;<br>in input mode Y-CB-CR 4 : 2 : 2 serial input data or luminance part of a 16-bit Y-CB-CR 4 : 2 : 2 data stream   | OFTS[3:0] (1BH[4], 13H[2:0]),<br>CONLV (91H[7], C1H[7]),<br>HLDFV (91H[6], C1H[6]),<br>SCSRC[1:0] (91H[5:4], C1H[5:4]),<br>SCRQE (91H[3], C1H[3]),<br>FSC[2:0] (91H[2:0], C1H[2:0]) |
| HPD7 to HPD0 | 64 -67, 69 - 72        | I/(O) | With the X-port, these signals are used as input only, for 16-bit Y-CB-CR 4 : 2 : 2 video data. In this case HPD[7:0] carries chrominance data.  | ICKS[3:0] (80H[3:0]),<br>SCSRC[1:0] (91H[5:4], C1H[5:4])  |
| XCLK         | 94                     | I/O   | clock at expansion port: if output, then copy of LLC; as input normally a double pixel clock of up to 32 MHz or a gated clock (clock gated with a qualifier)   | XCKS (92H[0], C2H[0])   |
| XDQ          | 95                     | I/O   | data valid flag of the expansion port input (qualifier): if output, then decoder (HREF and VGATE) gate (see Fig.24)  | –   |
| XRDY         | 96                     | O     | data request flag = ready to receive, to work with optional buffer in external device, to prevent internal buffer overflow;<br>second function: input related task flag A/B  | XRQT (83H[2])   |
| XRH          | 92                     | I/O   | horizontal reference signal for the X-port:<br>as output: HREF or HS from the decoder (see Fig.24) or bit 1 of D1 decoder 10 bit output;<br>as input: a reference edge for horizontal input timing and a polarity for input field ID detection can be defined  | XRHS (13H[6]),<br>XFDH (92H[6], C2H[6]),<br>XDH (92H[2], C2H[2])  |
| XRV          | 91                     | I/O   | vertical reference signal for the X-port:<br>as output: V123 or field ID from the decoder, see Figs 22 and or 23 or bit 0 of D1 decoder 10 bit output;<br>as input: a reference edge for vertical input timing and for input field ID detection can be defined | XRVS[1:0] (13H[5:4]),<br>XFDV (92H[7], C2H[7]),<br>XDV[1:0] (92H[5:4], C2H[5:4])  |
| XTRI         | 80                     | I     | port control: switches X-port input 3-state  | XPE[1:0] (83H[1:0])   |

#### 9.4.1 X-PORT CONFIGURED AS OUTPUT

If data output is enabled at the expansion port, then the data stream from the decoder is presented. The data format of the 8-bit data bus is dependent on the chosen data type, selectable by the line control registers LCR2 to LCR24; see Table 6. In contrast to the image port, the sliced data format is not available on the expansion port. Instead, raw CVBS samples are always transferred if any sliced data type is selected.

Some details of data types on the expansion port are as follows:

- **Active video** (data types 0 and 15): contains component  $Y-C_B-C_R$  4 : 2 : 2 signal, 720 active pixels per line. The amplitude and offsets are programmable via DBR17 to DBR10, DCON7 to DCON0, DSAT7 to DSAT0, OFFU1, OFFU0, OFFV1 and OFFV0. For nominal levels see Fig.18.
- **Test line** (data type 14): is similar to the active video format, with some constraints within the data processing:
  - adaptive chrominance comb filter, vertical filter (chrominance comb filter for NTSC standards, PAL phase error correction) within the chrominance processing are disabled
  - adaptive luminance comb filter, peaking and chrominance trap are bypassed within the luminance processing
 This data type is defined for future enhancements. It could be activated for lines containing standard test signals within the vertical blanking period. Currently the most sources do not contain test lines. For nominal levels see Fig.18.

- **Raw samples** (data types 1 to 13):  $C_B-C_R$  samples are similar to data type 6, but CVBS samples are transferred instead of processed luminance samples within the Y time slots.

The amplitude and offset of the CVBS signal is programmable via RAWG7 to RAWG0 and RAWO7 to RAWO0; see Chapter 16, Tables 78 and 79. For nominal levels see Fig.19.

The relationship of LCR programming to line numbers is described in Section 8.4, see Tables 7 to 10.

The data type selections by LCR are overruled by setting OFTS[3:0] = 1110 (ADC1 bypass mode) or OFTS[3:0] = 1111 (ADC2 bypass mode) at subaddresses 1BH, bit 4 and 13H bit 2 to 0. This setting is mainly intended for device production test. The X-port (XPD[7:0]) carries the upper 8 bits of either of the two ADCs, the LSB is provided on pin XRH; see Table 72 "RT / X-port output control (SA 13, SA 1B)". The analog input configuration is done via MODE[3:0] 02H[3:0] settings; see table 53 "Analog control 1 (SA 02)". No timing reference codes are generated in this mode.

The SAV/EAV timing reference codes define the start and end of valid data regions. The ITU-blanking code sequence '80 - 10 - 80 - 10 - ...' is transmitted during the horizontal blanking period between EAV and SAV.

The position of the F-bit is constant in accordance with ITU 656; see Tables 38 and 39.

The V-bit can be generated in two different ways (see Tables 38 and 39) controlled via OFTS1 and OFTS0; see Table 72.

In case of enabling 10-bit video output mode via OFTS[3:0] then XPD[7:0] carries the video data bits 9 to 2 and SAV/EAV codes and the signals XRH and XRV the data LSBs 1 and 0 respectively. During blanking both LSBs are zero.

The F and V bits change synchronously with the EAV code.

**Table 36** Data format on the expansion port

| BLANKING PERIOD |    |    | TIMING REFERENCE CODE (HEX) <sup>(1)</sup> |    |    |     | 720 PIXELS $Y-C_B-C_R$ 4 : 2 : 2 DATA <sup>(2)</sup> |    |    |    |    |    |     |      |      |    | TIMING REFERENCE CODE (HEX) <sup>(1)</sup> |    |     | BLANKING PERIOD |    |     |
|-----------------|----|----|--|----|----|-----|--|----|----|----|----|----|-----|------|------|----|--|----|-----|-----------------|----|-----|
| ...             | 80 | 10 | FF   | 00 | 00 | SAV | CB   | Y0 | CR | Y1 | CB | Y2 | ... | CR71 | Y719 | FF | 00   | 00 | EAV | 80              | 10 | ... |
|                 |    |    |  |    |    |     | 0  |    | 0  |    | 2  |    |     | 8    |      |    |  |    |     |                 |    |     |

#### Notes

1. The generation of the timing reference codes and the ITU-blanking code sequence can be suppressed by setting OFTS[3:0] to 'x010', see Table 72.
2. If raw samples or sliced data are selected by the line control registers (LCR2 to LCR24), the Y samples are replaced by CVBS samples.

#### 9.4.2 X-PORT CONFIGURED AS INPUT

If data input mode is selected at the expansion port, then the scaler can choose its input data stream from the on-chip video decoder, or from the expansion port (controlled by bit SCSRC[1:0] (91H[5:4], C1H[5:4])). Byte serial Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2, or subsets for other sampling schemes, or raw samples from an external ADC may be input (see also bits FSC[2:0] (91H[2:0], C1H[2:0])). The input stream must be accompanied by an external clock (XCLK), qualifier XDQ and reference signals XRH and XRV. Instead of the reference signal, embedded SAV and EAV codes according to ITU 656 are also accepted. The protection bits are not evaluated.

XRH and XRV carry the horizontal and vertical synchronization signals for the digital video stream through the expansion port. The field ID of the input video stream is carried in the phase (edge) of XRV and state of XRH, or directly as FS (frame sync, odd/even signal) on the XRV pin (controlled by XFDV (92H[7], C2H[7]), XFDH (92H[6], C2H[6]) and XDV[1:0] (92H[5:4], C2H[5:4])).

The trigger events on XRH (rising/falling edge) and XRV (rising/falling/both edges) for the scalers acquisition window are defined by XDV[1:0] and XDH (92H[2], C2H[2]). The signal polarity of the qualifier can also be defined (bit XDQ (92H[1], C2H[1])). Alternatively to a qualifier, the input clock can be applied to a gated clock (means clock gated with a data qualifier, controlled by bit XCKS (92H[0], C2H[0])). In this case, all input data will be qualified.

In case if 16 bit wide data input is required for the X-port input then the HPD[7:0] port is enabled for input via SCSRC[1:0] (91H[5:4], C1H[5:4]) whilst the I-port must be set to 8-bit output mode by ICKS[3:0] (80H[3:0]).

### 9.5 Image port (I-port)

The image port transfers data from the scaler as well as from the VBI-data slicer, if selected (maximum 33 MHz). The reference clock is available at the ICLK pin, as an output, or as an input (maximum 33 MHz). As output, ICLK is derived either from the line-locked decoder or from the expansion port input clock or from PLL2/CGC2 combination, which enables square pixel clock generation feature.

The data stream from the scaler output is usually discontinuous, which basically depends on the scale ratio. Therefore valid data during a clock cycle is accompanied by a data qualifying (data valid) flag on pin IDQ. For pin constrained applications the IDQ pin can be programmed to function as a gated clock output (bit ICKS2[80H[2]]).

The pulsegenerator allows however to squeeze all pixels of a video line so that a continuous video stream at the I-port output is obtained. For details refer to chapter 8.2..

The data formats at the image port are defined in Dwords of 32 bits (4 bytes), such as the related FIFO structures. However the physical data stream at the image port is only 16-bit or 8-bit wide; in 16-bit mode data pins HPD7 to HPD0 are used for chrominance data. The four bytes of the Dwords are serialized in words or bytes.

Available formats are as follows:

- Y-C<sub>B</sub>-C<sub>R</sub> 4 : 2 : 2
- Y-C<sub>B</sub>-C<sub>R</sub> 4 : 1 : 1
- Raw samples
- Decoded VBI-data.

For handshake with the receiving VGA controller, or other memory or bus interface circuitry, F, H and V reference signals and programmable FIFO flags are provided. The information is provided on pins IGP0, IGP1, IGPH and IGPV. The functionality on these pins is controlled via subaddresses 84H and 85H.

VBI-data is collected over an entire line in its own FIFO, and transferred as an uninterrupted block of bytes. Decoded VBI-data can be indicated by the VBI flag on pin IGP0 or IGP1.

As scaled video data and decoded VBI-data may come from different and asynchronous sources, an arbitration scheme is needed. Normally the VBI-data slicer has priority.

The image port consists of the pins and/or signals, as listed in Table 40.

|                        |                      |          |          |
|------------------------|----------------------|----------|----------|
| Philips Semiconductors | CVIP2                | Date:    | 10/23/01 |
| CS-PD Hamburg          | Datasheet<br>SAA7115 | Version: | 0.67     |

For pin constrained applications, or interfaces, the relevant timing and data reference signals can also be encoded into the data stream. Therefore the corresponding signal pins do not need to be connected. The minimum image port configuration requires 9 pins only, i.e. 8 pins for data including codes, and 1 pin for clock or gated clock. The inserted codes are defined in close relationship to the ITU-R BT.656 (D1) recommendation, where possible.

In the case of scaling and for CMOD [80[7]] = '0', the following deviations from "ITU 656 recommendation" are implemented at the SAA7115s image port interface:

- SAV and EAV codes are only present in those lines, where data is to be transferred, i.e. active video lines, or VBI raw samples, no codes for empty lines (=lines not covered by the scalers window definition)
- There may be more or less than 720 pixels between SAV and EAV depending on the scaler settings
- Data content and the number of clock cycles during horizontal and vertical blanking is undefined, and may not be constant. To get a regular pattern in case of scaling, the internal trigger positions for data packing (see section 8.5.4.2.) need to be balanced.
- Data stream may be interleaved with not-valid data, 00H codes or old data (see bit INS80 [93[6]]), but SAV and EAV 4-byte codes are not interleaved with not-valid data codes
- There may be an irregular pattern of not-valid data, or IDQ, and as a result, C<sub>B</sub>-Y-C<sub>R</sub>-Y is not in a fixed phase to a regular clock divider
- VBI raw sample streams are enveloped with SAV and EAV, like normal video
- Decoded VBI-data is transported as Ancillary (ANC) data or enveloped with SAV and EAV (see bits SLDOM [5D[4:0]]), two modes:
  - direct decoded VBI-data bytes (8-bit), 00H and FFH codes may appear in the data block (violation to ITU-R BT.656)
  - recoded VBI-data bytes (8-bit), 00H and FFH codes will be recoded to even parity codes 03H and FCH to suppress invalid ITU-R BT.656 codes.

Sliced VBI data are transferred as continuous packages with no empty cycles.

The data codes 00H and FFH are suppressed (changed to 01H or FEH respectively) in the active video stream, as well as in the VBI raw sample stream (VBI pass-through). Optionally, the number range can be further limited (see bit ILLV [85[5]]).

If the video data are not packed and ITRDY = '1', due to the internal 32 bit wide backend FIFO, valid data occur as 4 byte (8 bit output), respec. 2 byte (16 bit output) packages of valid data.

**Table 40** Signals dedicated to the image port

| SYMBOL       | PIN                | I/O   | DESCRIPTION  | BIT   |

### 9.6 Host port for 16-bit extension of video data I/O (H-port)

The H-port pins HPD can be used for extension of the data I/O paths to 16-bit. For the X-port HPD[7:0] are used as 16-bit input extension where as the I-port uses HPD[7:0] as 16-bit output extension.

The I-port has functional priority. If a 16 bit output mode is set via ICKS[3:2], see table 121 “I-port and scaler backend clock selection (SA 80)” the output drivers of the H-port are enabled depending on the I-port enable control.

**Table 41** Signals dedicated to the host port

| SYMBOL       | PIN             | I/O   | DESCRIPTION  | BIT   |
|--------------|-----------------|-------|--|---|
| HPD7 to HPD0 | 64 -67, 69 - 72 | I(O)  | With the X-port, these signals are used as input only, for 16-bit Y-CB-CR 4 : 2 : 2 video data. In this case HPD[7:0] carries chrominance data.  | ICKS[3:0] (80H[3:0]),<br>SCSRC[1:0] (91H[5:4], C1H[5:4]),<br>IPE[1:0] (87H[1:0]),<br>ITRI ([8FH[6]) |
|              |                 | (I)/O | With the I-port, these signals are used as output only, for 16-bit Y-CB-CR 4 : 2 : 2 video data. In this case HPD[7:0] carries chrominance data. |   |

## 9.7 Basic input and output timing diagrams I-port and X-port

### 9.7.1 I-PORT OUTPUT TIMING

The following diagrams (figures 33 to 39) illustrate the output timing via the I-port. IGPH and the scalers IGPV are logic 1 active gate signals. If reference pulses are programmed, these pulses are generated on the rising edge of the logic 1 active gates. Valid data is accompanied by the output data qualifier on pin IDQ.

An data request via ITRDY = '1' is answered with the next clock cycle by marking this cycle as valid or invalid data. Due to the scaling and the output processing, it may last several ITRDY = '1' cycles, before a request is answered with valid data. After running in and if the requested data rate is matched to the scaled data rate, valid data are normally provided with the next clock cycle.

The behaviour during invalid clock cycles depend on the INS80 bit and the ITRDY input.

For INS80 = '0' the value 00H is inserted on IPD[7:0], resp. HPD[7:0], for all clock cycles marked with IDQ = '0'

For INS80 = '1' data are hold during a line, if ITRDY = '0' or IDQ='0'. Outside the active line and in 8 bit output mode, the inserted blanking values ('80H', '10H') change with every ITRDY = '1'.

As there are now internal counters for data packing implemented (see sect. 8.5.4.2 and parameters PGHAPS, PGHBPS and PGHCPS), the ITRDY packing is mainly useful for burst data transfers.

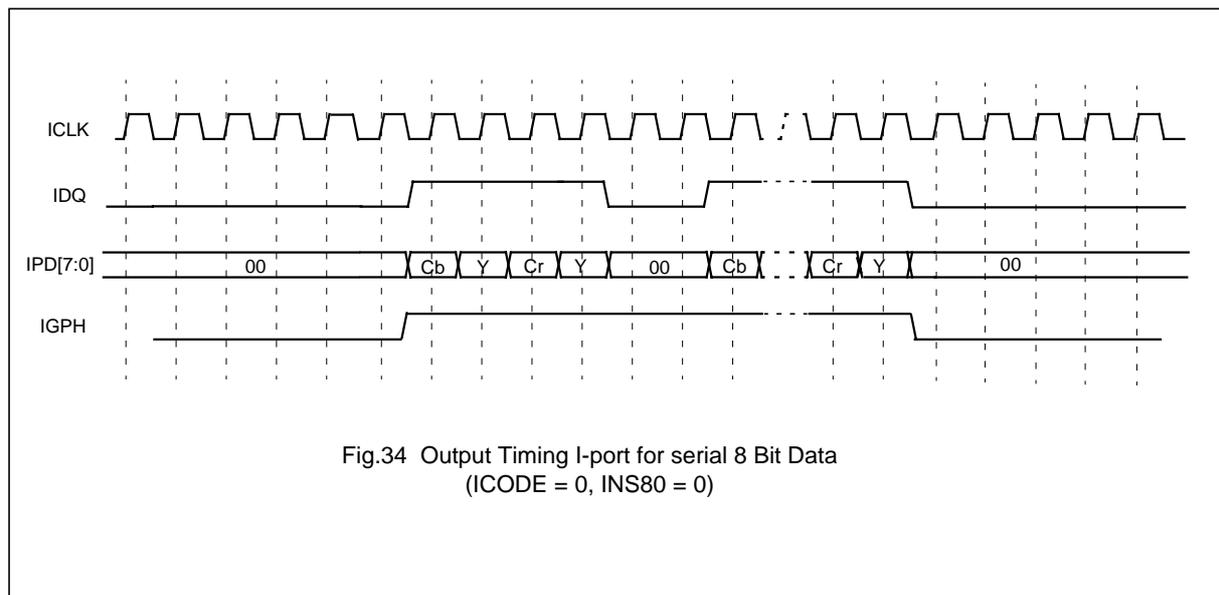

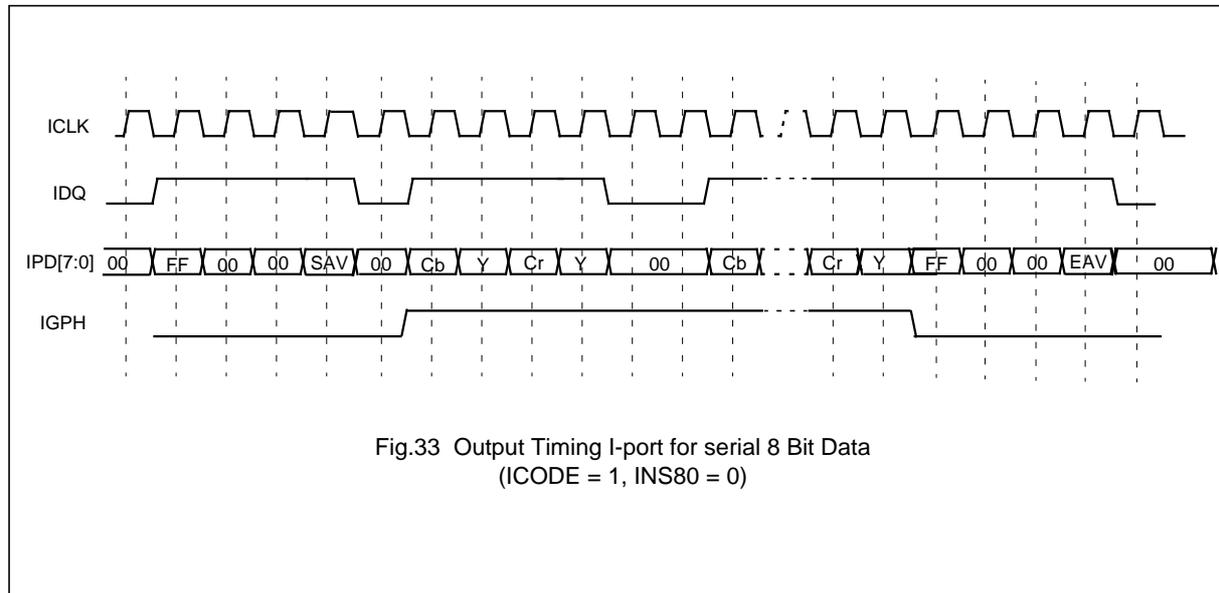

The IDQ output pin may be defined to be a gated clock output signal (ICLK AND internal IDQ).

### 9.7.2 X-PORT INPUT TIMING

At the X-port the input timing requirements are the same as those for the I-port output. But different to those below:

- It is not necessary to mark invalid cycles with a 00H code
- No constraints on the input qualifier (can be a random pattern)
- XCLK may be a gated clock (XCLK AND external XDQ).

**Remark:** All timings illustrated in figures 33 to 39 are given for an uninterrupted output stream (no handshake with the external hardware).

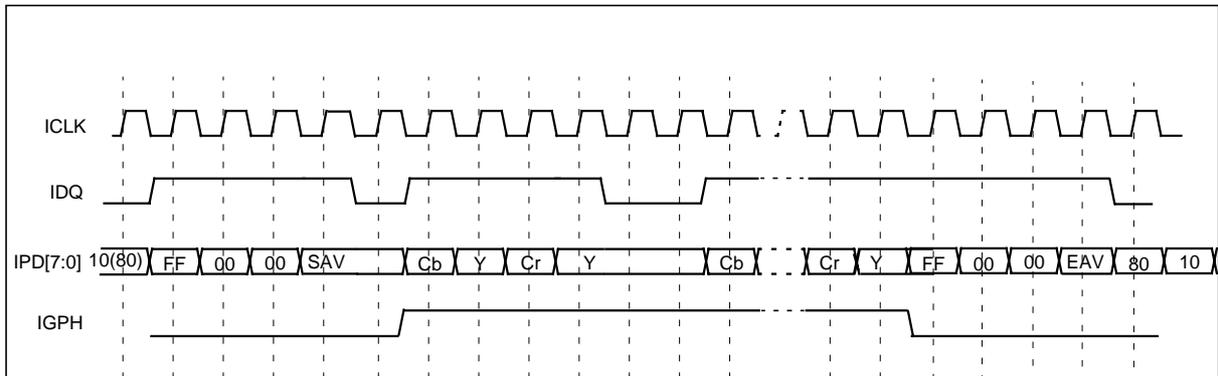

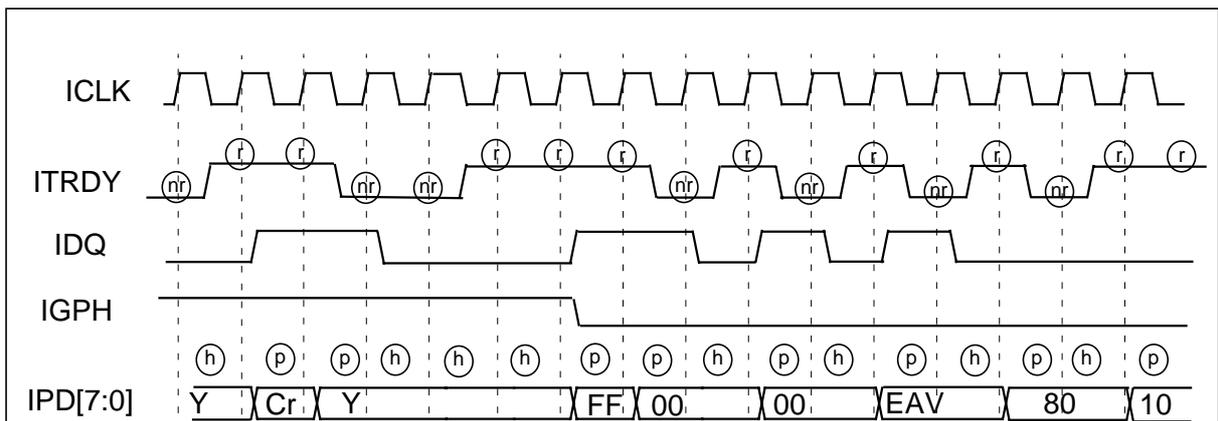

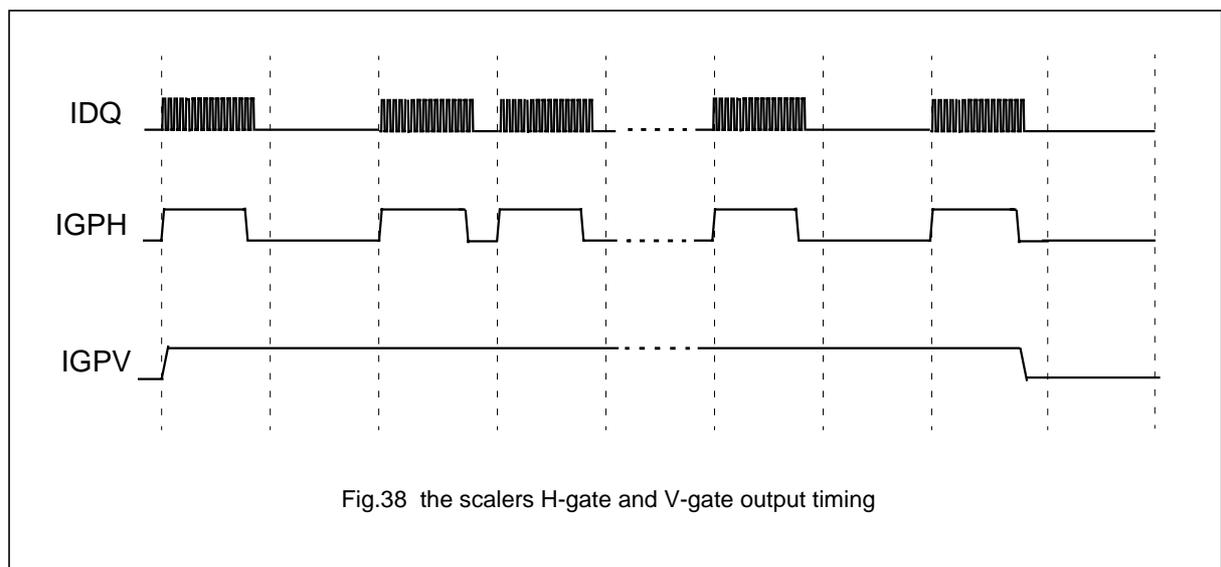

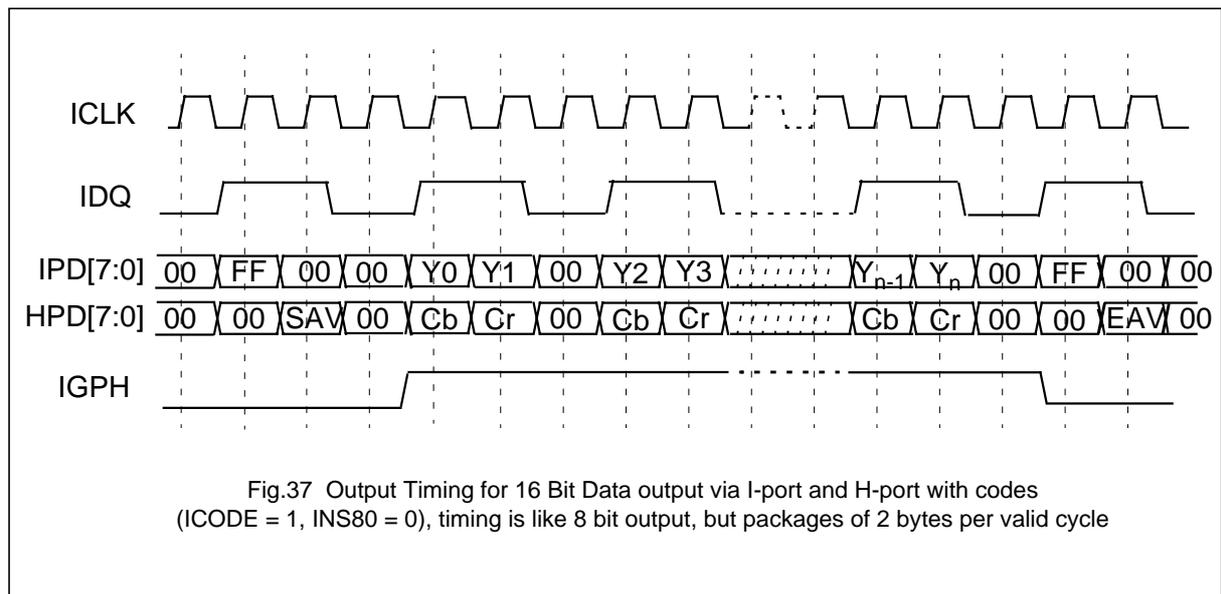

Fig.35 Output Timing I-port for serial 8 Bit Data  
(ICODE = 1, INS80 = 1)

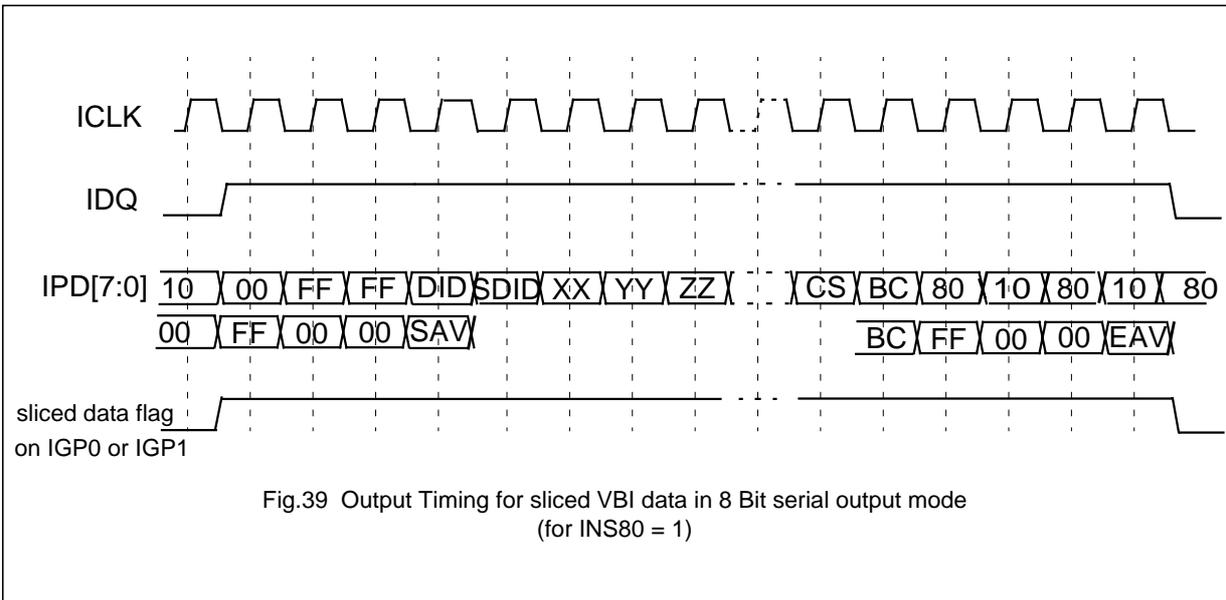

- (r) = request new data
- (nr) = no request
- (p) = new data are placed
- (h) = hold data

IDQ = 1 and IGPH = 0 = SAV or EAV sequence

## 10 BOUNDARY SCAN TEST

The SAA7115 has built-in logic and 5 dedicated pins to support boundary scan testing which allows board testing without special hardware (nails). The SAA7115 follows the "IEEE Std. 1149.1 - Standard Test Access Port and Boundary-Scan Architecture" set by the Joint Test Action Group (JTAG) chaired by Philips.

The 5 special pins are Test Mode Select (TMS), Test Clock (TCK), Test Reset (TRSTN), Test Data Input (TDI) and Test Data Output (TDO).

The Boundary Scan Test (BST) functions BYPASS, EXTEST, INTEST, SAMPLE, CLAMP and IDCODE are all supported (see Table 42). Details about the JTAG BST-TEST can be found in specification "IEEE Std. 1149.1". A file containing the detailed Boundary Scan Description Language (BSDL) description of the SAA7115 is available on request.

**Table 42** BST instructions supported by the SAA7115

| INSTRUCTION | DESCRIPTION  |
|-------------|--|
| BYPASS      | This mandatory instruction provides a minimum length serial path (1 bit) between TDI and TDO when no test operation of the component is required.  |
| EXTEST      | This mandatory instruction allows testing of off-chip circuitry and board level interconnections.  |
| SAMPLE      | This mandatory instruction can be used to take a sample of the inputs during normal operation of the component. It can also be used to preload data values into the latched outputs of the boundary scan register. |
| CLAMP       | This optional instruction is useful for testing when not all ICs have BST. This instruction addresses the bypass register while the boundary scan register is in external test mode.                               |
| IDCODE      | This optional instruction will provide information on the components manufacturer, part number and version number.   |
| INTEST      | This optional instruction allows testing of the internal logic (no customer support available).  |
| USER1       | This private instruction allows testing by the manufacturer (no customer support available).   |

### 10.1 Initialization of boundary scan circuit

The TAP (Test Access Port) controller of an IC should be in the reset state (TEST\_LOGIC\_RESET) when the IC is in functional mode. This reset state also forces the instruction register into a functional instruction such as IDCODE or BYPASS.

To solve the power-up reset, the standard specifies that the TAP controller will be forced asynchronously to the TEST\_LOGIC\_RESET state by setting the TRSTN pin LOW.

### 10.2 Device identification codes

A device identification register is specified in "IEEE Std. 1149.1b-1994". It is a 32-bit register which contains fields for the specification of the IC manufacturer, the IC part number and the IC version number. Its biggest advantage is the possibility to check for the correct ICs mounted after production and determination of the version number of ICs during field service.

When the IDCODE instruction is loaded into the BST instruction register, the identification register will be connected between TDI and TDO of the IC. The identification register will load a component specific code during the CAPTURE\_DATA\_REGISTER state of the TAP controller and this code can subsequently be shifted out. At board level this code can be used to verify component manufacturer, type and version number. The device identification register contains 32 bits, numbered 31 to 0, where bit 31 is the most significant bit (nearest to TDI) and bit 0 is the least significant bit (nearest to TDO); see Fig.40.

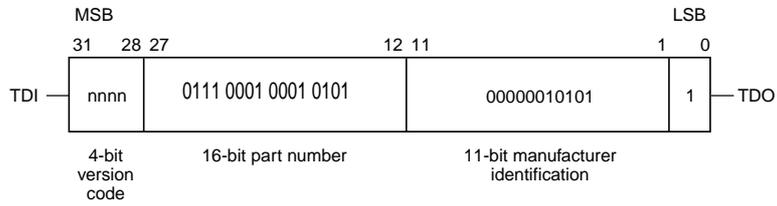

Fig.40 32 bits of identification code.

## 11 LIMITING VALUES

**Table 43** Limiting Values

| SYMBOL  | PARAMETER  | Conditions                           | MIN   | MAX                     | UNIT |

| $t_f$  | fall time  | 2.6 to 0.6 V  | –    | –    | 5    | ns   |

#### Notes

- ADC1 is not taken into account, since component video is always converted by ADC2, ADC3 and ADC4.
- $V_{DD(I2C)}$  is the supply voltage of the I<sup>2</sup>C-bus. For  $V_{DD(I2C)} = 3.3$  V is  $V_{IL(SCL,SDA)(max)} = 1$  V; for  $V_{DD(I2C)} = 5$  V is  $V_{IL(SCL,SDA)(max)} = 1.5$  V. For  $V_{DD(I2C)} = 3.3$  V is  $V_{IH(SCL,SDA)(min)} = 2.3$  V; for  $V_{DD(I2C)} = 5$  V is  $V_{IH(SCL,SDA)(min)} = 3.5$  V.
- The levels must be measured with load circuits; 1.2 k $\Omega$  at 3 V (TTL load);  $C_L = 50$  pF.
- The effects of rise and fall times are included in the calculation of  $t_{OHD:DAT}$  and  $t_{PD}$ . Timings and levels refer to drawings and conditions illustrated in Fig.41.
- The crystal oscillator drive level is typical 0.28 mW.

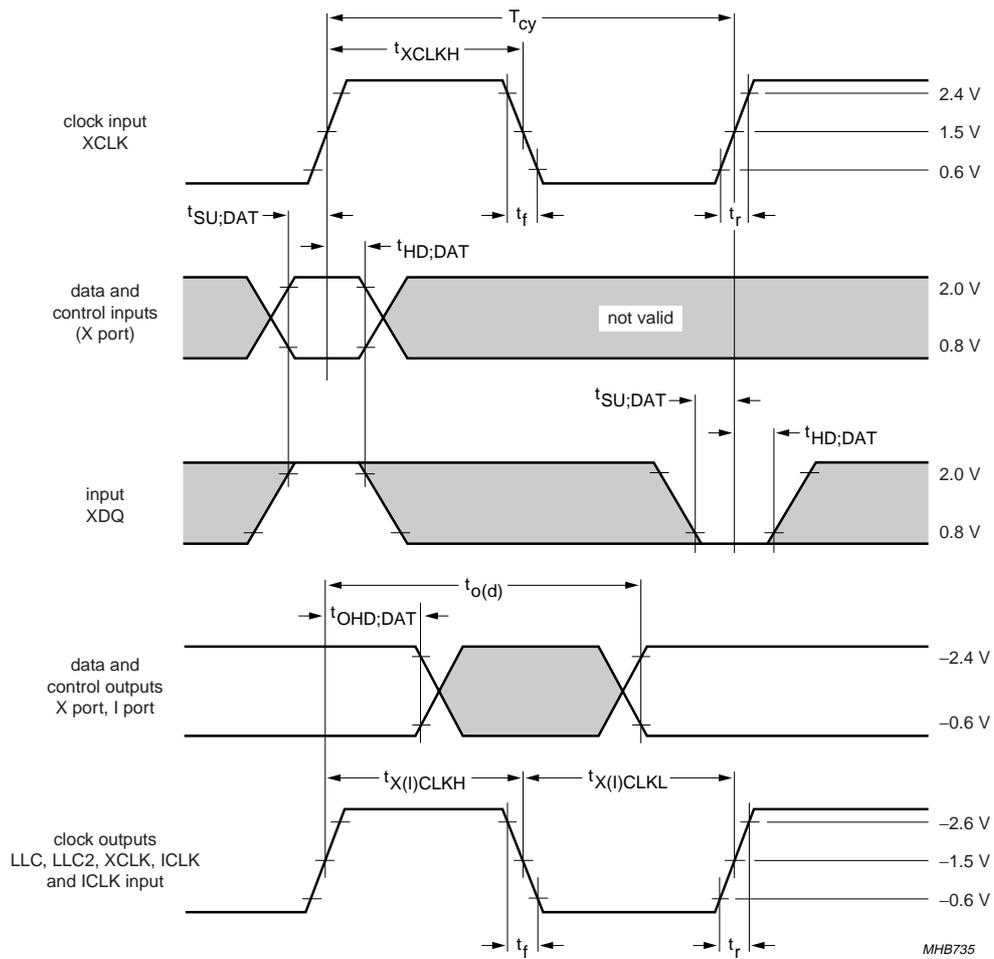

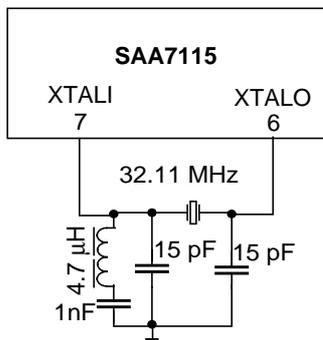

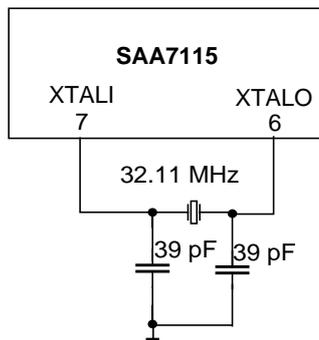

Fig.41 Data input/output timing diagram (X-port, RT port and I-port).

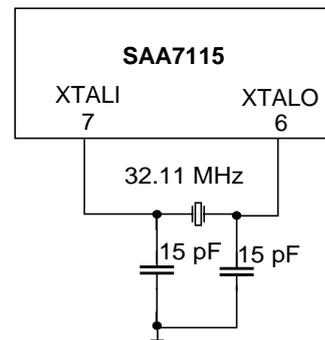

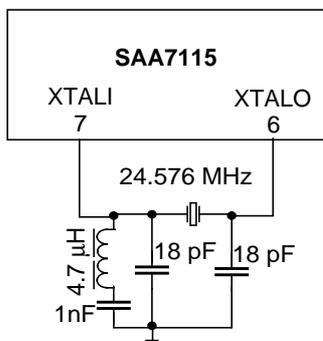

(1a) With 3rd harmonic quartz.  
Crystal load = 8 pF

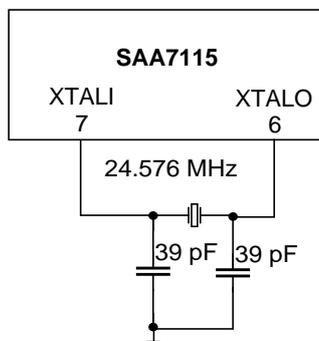

(1b) With fundamental quartz.  
Crystal load = 20 pF

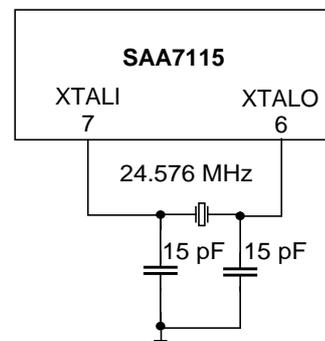

(1c) With fundamental quartz.  
Crystal load = 8 pF

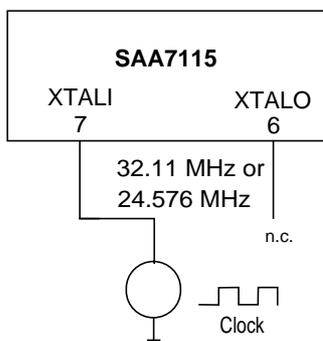

(2a) With 3rd harmonic quartz.

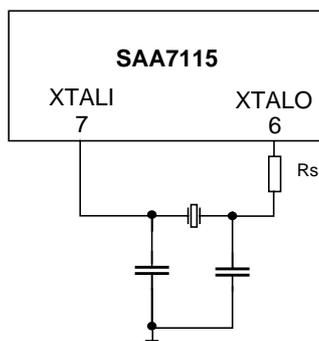

(2b) With fundamental quartz.

(2c) With fundamental quartz.

(3a) With direct clock

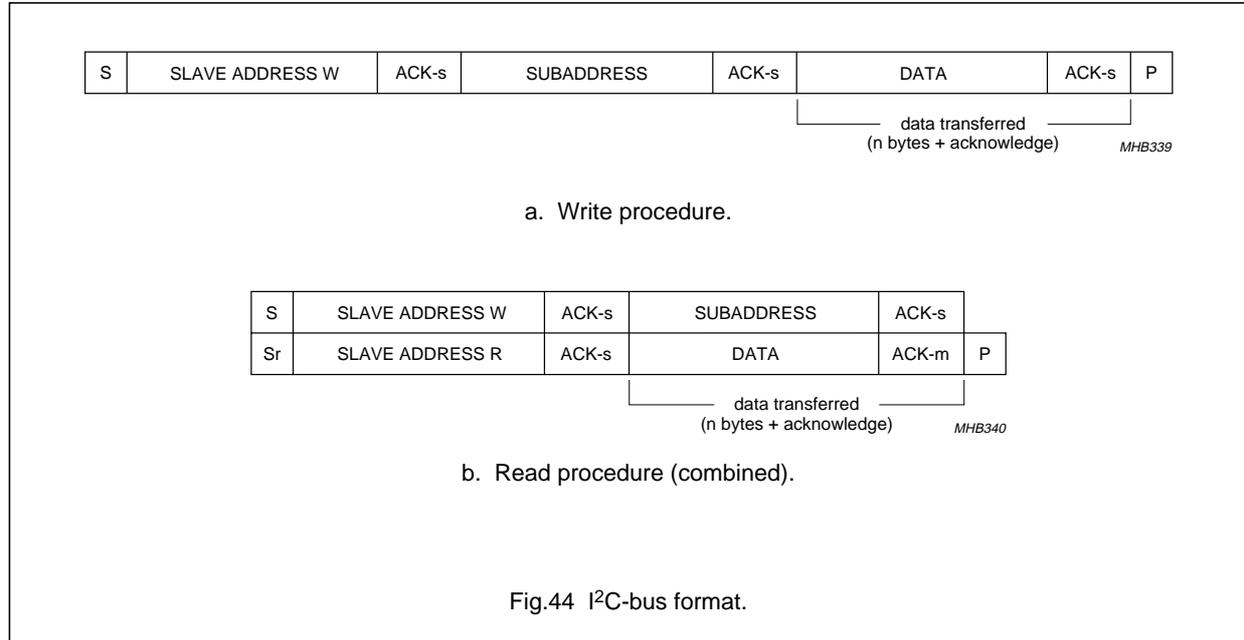

(3b) With fundamental quartz crystal and restricted drive level. When  $P_{drive}$  of the internal oscillator is too high a resistance  $R_s$  can be placed in series with the output of the oscillator XTALO.  
Note: The decreased crystal amplitude results in a lower drive level but on the other hand the jitter performance will decrease.

Fig.43 Oscillator applications

## 15 DEVICE PROGRAMMING OVERVIEW

### 15.1 I<sup>2</sup>C-bus description

**Table 46** Description of I<sup>2</sup>C-bus format

| CODE            | DESCRIPTION  |
|-----------------|--|
| S               | START condition  |
| Sr              | repeated START condition   |
| SLAVE ADDRESS W | '0100 0010' (42H, default) or '0100 0000' (40H; note 1)  |
| SLAVE ADDRESS R | '0100 0011' (43H, default) or '0100 0001' (41H; note 1)  |
| ACK-s           | acknowledge generated by the slave   |
| ACK-m           | acknowledge generated by the master  |
| SUBADDRESS      | subaddress byte; see Tables 47 and 48  |
| DATA            | data byte; see figure 44; if more than one byte DATA is transmitted the subaddress pointer is automatically incremented                                    |
| P               | STOP condition   |
| X               | read/write control bit (LSB slave address); X = 0, order to write (the circuit is slave receiver); X = 1, order to read (the circuit is slave transmitter) |

#### Note

1. If pin RTCO strapped to supply voltage via a 4.7 kΩ resistor.

## 15.2 Register Overview

**Table 47** Subaddress description and access

| SUBADDRESS   | DESCRIPTION                                  | ACCESS (READ/WRITE) |
|--|--|---------------------|
| 00H  | chip version                                 | read only           |
| <b>Video decoder: 01H to 2FH</b>                                 |  |                     |
| 01H to 05H   | front-end part                               | read and write      |
| 06H to 19H   | decoder part                                 | read and write      |
| 1AH to 1DH   | color decoding, misc                         | read and write      |
| 1EH to 1FH   | video decoder status byte                    | read only           |
| 20H to 2FH   | reserved                                     | –                   |
| <b>Audio clock generation: 30H to 3FH</b>                        |  |                     |
| 30H to 3AH   | audio clock generator                        | read and write      |
| 3BH to 3FH   | reserved                                     | –                   |
| <b>General purpose VBI-data slicer: 40H to 7FH</b>               |  |                     |
| 40H to 5BH   | VBI-data slicer                              | read and write      |
| 5CH  | reserved                                     | –                   |
| 5DH to 5EH   | VBI-data slicer                              | read and write      |
| 5FH  | reserved                                     | –                   |
| 60H to 65H   | VBI-data slicer status                       | read only           |
| 66H to 7FH   | I <sup>2</sup> C readback of sliced VBI data | read only           |
| <b>X-port, I-port, scaler and power save control: 80H to EFH</b> |  |                     |
| 80H to 8FH   | task independent global settings             | read and write      |
| 90H to BFH   | task A definition                            | read and write      |
| C0H to EFH   | task B definition                            | read and write      |
| <b>Second PLL (PLL2) and Pulsegenerator: F0H to FFH</b>          |  |                     |
| F0H to F4H   | Second PLL settings                          | read and write      |
| F5H to FBH   | Pulsegenerator                               | read and write      |
| FCH to FEH   | reserved                                     | read and write      |
| FFH  | Second PLL, lock status definition           | read and write      |

## 16 DETAILED DESCRIPTION OF THE CONTROL REGISTERS

### 16.1 Chip Version / Ident Register

#### 16.1.1 CHIP VERSION

**Table 49** Chip version (SA00), read only register

| FUNCTION <sup>(1)</sup> | LOGIC LEVELS |      |      |      |
|-------------------------|--------------|------|------|------|
|                         | ID07         | ID06 | ID05 | ID04 |
| CHIP VERSION (CV)       | CV3          | CV2  | CV1  | CV0  |

1. This register contains the current version identification number of the chip. Initial version: 0001.

#### 16.1.2 CHIP ID

**Table 50** Chip ID (SA00)

| FUNCTION <sup>(1)</sup> | WRITE (HEX) | READ BACK (HEX)<br>ID3 TO ID0 |
|-------------------------|-------------|-------------------------------|
| CHIP ID                 | 00          | 1                             |
|                         | 01          | F                             |
|                         | 02          | 7                             |
|                         | 03          | 1                             |
|                         | 04          | 1                             |
|                         | 05          | 5                             |
|                         | 06          | D                             |
|                         | 07          | 0                             |
|                         | 08          | E                             |
|                         | 09          | VERSION                       |
|                         | 0A .. OF    | 0                             |

1. This register can be evaluated by alternating write/read cycles

## 16.2 Programming Register Decoder

### 16.2.1 SUBADDRESS 01 ANALOG INPUT CONTROL 0, INCREMENT DELAY

**Table 51** Horizontal Increment delay (SA 01)

| FUNCTION <sup>(1)</sup>     | IDEL3    | IDEL2    | IDEL1    | IDEL0    |
|-----------------------------|----------|----------|----------|----------|
| no update                   | 1        | 1        | 1        | 1        |
| min. delay                  | 1        | 1        | 1        | 0        |
| <b>recommended position</b> | <b>1</b> | <b>0</b> | <b>0</b> | <b>0</b> |
| max delay                   | 0        | 0        | 0        | 0        |

1. The programming of the horizontal Increment delay is used to match internal processing delays to the delay of the AD-converter. Use recommended position only.

**Table 52** Analog control 0 (SA01)

| FUNCTION   | LOGIC LEVELS           |        |
|--|------------------------|--------|
|  | control bits D5 and D4 |        |

| Mode 10 to 15: reserved  | 1                      | 0      | 1     |       |
|  | 1                      | ...    | ...   | ...   |
|  | 1                      | 1      | 1     | 1     |
|  |                        |        |       |       |
| Analog function select FUSE, see Figure 7 on page 25   | control bits D7 and D6 |        |       |       |
|  | FUSE 1                 | FUSE 0 |       |       |
| Amplifier plus anti-alias filter bypassed  | 0                      | 0      |       |       |
|  | 0                      | 1      |       |       |
| Amplifier active   | 1                      | 0      |       |       |
| Amplifier plus anti-alias filter active  | 1                      | 1      |       |       |

1. In order to reduce power consumption of the device use the registers CH1EN and CH2EN (subaddress 88h, bits 7 and 6) to switch of either of the ADCs not used in CVBS modes.

Note: To take full advantage of the YC-modes 6 to 9 the I<sup>2</sup>C-bit BYPS (sub address 09h, bit 7) must be set to "1" (full luminance bandwidth)

Table 54 Effects of MODE[3:0] settings

**Table 54** Effects of MODE[3:0] settings

Note: To take full advantage of the YC-modes 6 to 9 the control-bit BYPS (sub address 09h, bit 7) should be set to "1" (full luminance bandwidth)

### 16.2.3 SUBADDRESS 03 ANALOG INPUT CONTROL 2

**Table 55** Analog control 2 (AICO2) (SA03)

| FUNCTION   | LOGIC LEVEL  | DATA BIT |
|--|--------------|----------|
| <b>Static gain control channel 1 (GAI18) (see SA04)</b>  |              |          |
| Sign bit of gain control   | see Table 56 | D0       |
| <b>Static gain control channel 2 (GAI28) (see SA05)</b>  |              |          |
| Sign bit of gain control   | see Table 57 | D1       |
| <b>Gain control fix (GAFIX)</b>  |              |          |
| Automatic gain controlled by MODE[3:0]   | 0            | D2       |
| Gain is user programmable via GAI1 + GAI2  | 1            |          |
| <b>Automatic gain control integration (HOLDG)</b>  |              |          |
| AGC active   | 0            | D3       |
| AGC integration hold (frozen)  | 1            |          |
| <b>Color peak off (CPOFF)</b>  |              |          |
| Color peak control active (AD-signal is attenuated, if maximum input level is exceeded, avoids clipping effects on screen)                     | 0            | D4       |
| Color peak off   | 1            |          |
| <b>AGC hold during Vertical blanking period (VBSL)</b>   |              |          |
| Short vertical blanking (AGC disabled during equalization- and serration pulses)   | 0            | D5       |
| Long vertical blanking (AGC disabled from start of pre equalization pulses until start of active video (line 22 for 60 Hz, line 24 for 50 Hz)) | 1            |          |
| <b>HL not reference select (HLNRS)</b>   |              |          |
| Normal clamping if decoder is in unlocked state  | 0            | D6       |
| Reference select if decoder is in unlocked state   | 1            |          |

16.2.4 SUBADDRESS 04 ANALOG INPUT CONTROL 3

**Table 56** Gain control analog (AIC03); static gain control channel 1 GAI1 (SA 03, SA 04)

| DECIMAL VALUE | GAIN (dB) | SIGN BIT 03H D0 | CONTROL BITS 04H D7 TO 04H D0 |       |       |       |       |       |       |       |
|---------------|-----------|-----------------|-------------------------------|-------|-------|-------|-------|-------|-------|-------|

16.2.8 SUBADDRESS 08 SYNC CONTROL

**Table 60** Sync control (SA 08)

| FUNCTION  | CONTROL BITS | LOGIC LEVELS | DATA BITS |
|---|--------------|--------------|-----------|
| <b>Vertical noise reduction (VNOI)</b>  |              |              |           |
| Normal mode ( <b>recommended setting</b> )  | VNOI1        | 0            | D1        |
|   | VNOI0        | 0            | D0        |
| Fast mode (applicable for stable sources only, automatic field detection [AUFD] must be disabled)               | VNOI1        | 0            | D1        |
|   | VNOI0        | 1            | D0        |
| Free running mode   | VNOI1        | 1            | D1        |
|   | VNOI0        | 0            | D0        |
| Vertical noise reduction bypassed   | VNOI1        | 1            | D1        |
|   | VNOI0        | 1            | D0        |
| <b>Horizontal PLL (HPLL)</b>  |              |              |           |
| PLL closed  | HPLL         | 0            | D2        |
| PLL open, horizontal frequency fixed  | HPLL         | 1            |           |
| <b>Horizontal time constant selection (HTC1, HTC0)</b>  |              |              |           |
| TV mode<br>(recommended for poor quality TV signals only, do not use for new applications)                      | HTC1, HTC0   | 00           | D4,D3     |
| VTR mode (recommended if a deflection control circuit is directly connected at the output of the decoder)       |              | 01           |           |
| automatic TV/VRC detection ( <b>recommended setting</b> )<br>threshold is programmable via ATVT[1:0], see SA 1B |              | 10           |           |
| fast locking mode   |              | 11           |           |
| <b>Forced ODD/EVEN toggle FOET</b>  |              |              |           |
| ODD/EVEN-signal toggles only with interlaced source   | FOET         | 0            | D5        |
| ODD/EVEN-signal toggles field wise even if source is non-interlaced   |              | 1            |           |
| <b>Field selection (FSEL, active, if AUFD = 1)</b>  |              |              |           |
| 50 Hz, 625 lines  | FSEL         | 0            | D6        |
| 60 Hz, 525 lines  |              | 1            |           |
| <b>Automatic field detection (AUFD)</b>   |              |              |           |
| Field state directly controlled via FSEL  | AUFD         | 0            | D7        |
| Automatic field detection ( <b>recommended setting</b> )  |              | 1            |           |

16.2.9 SUBADDRESS 09 LUMINANCE CONTROL

**Table 61** Luminance control (SA 09)

| FUNCTION   | BITS      | LOGIC LEVELS | DATA BITS |
|--|-----------|--------------|-----------|
| <b>Sharpness Control, Luminance filter characteristic (LUF1), see Figure 17 on page 37</b> |           |              |           |
| resolution enhancement filter 8.0 dB at 4.1 MHz  | LUF1[3:0] | 0001         | D3 .. D0  |
| resolution enhancement filter 6.8 dB at 4.1 MHz  | LUF1[3:0] | 0010         |           |
| resolution enhancement filter 5.1 dB at 4.1 MHz  | LUF1[3:0] | 0011         |           |
| resolution enhancement filter 4.1 dB at 4.1 MHz  | LUF1[3:0] | 0100         |           |
| resolution enhancement filter 3.0 dB at 4.1 MHz  | LUF1[3:0] | 0101         |           |
| resolution enhancement filter 2.3 dB at 4.1 MHz  | LUF1[3:0] | 0110         |           |
| resolution enhancement filter 1.6 dB at 4.1 MHz  | LUF1[3:0] | 0111         |           |
| <b>PLAIN</b>   | LUF1[3:0] | 0000         |           |
| low pass filter 2 dB at 4.1 MHz  | LUF1[3:0] | 1000         |           |
| low pass filter 3 dB at 4.1 MHz  | LUF1[3:0] | 1001         |           |
| low pass filter 3 dB at 3.3 MHz, 4 dB at 4.1 MHz   | LUF1[3:0] | 1010         |           |
| low pass filter 3 dB at 2.6 MHz, 8 dB at 4.1 MHz   | LUF1[3:0] | 1011         |           |
| low pass filter 3 dB at 2.4 MHz, 14 dB at 4.1 MHz  | LUF1[3:0] | 1100         |           |
| low pass filter 3 dB at 2.2 MHz, notch at 3.4 MHz  | LUF1[3:0] | 1101         |           |
| low pass filter 3 dB at 1.9 MHz, notch at 3.0 MHz  | LUF1[3:0] | 1110         |           |
| low pass filter 3 dB at 1.7 MHz, notch at 2.5 MHz  | LUF1[3:0] | 1111         |           |
| <b>Remodulation bandwidth for luminance (LUBW), see figures 13 to 16</b>                   |           |              |           |
| Small remodulation bandwidth<br>(narrow chroma notch => higher luminance bandwidth)        | LUBW      | 0            | D4        |
| Large remodulation bandwidth<br>(wider chroma notch => smaller luminance bandwidth)        | LUBW      | 1            |           |
| <b>Processing delay in non combfilter mode (LDEL)</b>                                      |           |              |           |
| Processing delay is equal to internal pipelining delay<br><b>(recommended setting)</b>     | LDEL      | 0            | D5        |
| One (NTSC-standards) or two (PAL-standards) video lines additional processing delay        | LDEL      | 1            |           |
| <b>Adaptive luminance comb filter (YCOMB)</b>  |           |              |           |
| Disabled (= chrominance trap enabled, if BYPS = 0)   | YCOMB     | 0            | D6        |
| Active, if BYPS = 0  | YCOMB     | 1            |           |
| <b>Chrominance trap / comb filter bypass (BYPS)</b>  |           |              |           |
| Chrominance trap or luminance comb filter active,<br>default for CVBS mode                 | BYPS      | 0            | D7        |
| Chrominance trap or luminance comb filter bypassed;<br>default for S-Video mode            | BYPS      | 1            |           |

#### 16.2.10 SUBADDRESS 0A DECODER BRIGHTNESS

**Table 62** Luminance brightness control decoder part DBRI7 to DBRI0 (SA 0A)

| OFFSET          | CONTROL BITS D7 to D0 |       |       |       |       |       |       |       |
|-----------------|-----------------------|-------|-------|-------|-------|-------|-------|-------|

| <b>Automatic chrominance standard detection control 0 (AUTO0)</b><br><b>NOTE: Automatic chrominance standard detection control 1 (AUTO1) is located at subaddress 14h, D2</b>   |           |              |                      |      |      |       |       |       |      |      |          |   |     |   |   |   |      |   |            |   |     |   |   |   |      |   |         |   |     |   |   |   |      |   |           |   |     |   |   |   |      |   |             |   |     |   |   |   |      |   |          |   |     |   |   |   |      |   |       |   |     |   |   |   |      |   |           |   |     |   |   |   |      |   |       |   |     |   |   |   |      |   |
| <p>The automatic standard detection circuit does not only search and lock to any broadcast standard, but provides also some default settings dependent on the chosen automatic level. e.g it automatically disables the combfilter or remodulation functionality if Y/C-mode is selected or a B&amp;W source is present. Also the bandwidths of the internal filters are adapted to the detected standard.</p> <p>However, if these settings are not convenient for the customers application, lower auto levels can be chosen, so that only the standard search and lock is active and all other settings can be programmed independently.</p>   |           |              |                      |      |      |       |       |       |      |      |          |   |     |   |   |   |      |   |            |   |     |   |   |   |      |   |         |   |     |   |   |   |      |   |           |   |     |   |   |   |      |   |             |   |     |   |   |   |      |   |          |   |     |   |   |   |      |   |       |   |     |   |   |   |      |   |           |   |     |   |   |   |      |   |       |   |     |   |   |   |      |   |

| reserved  | reserved  |              | 011                 |                  |
| preferred Standard is PAL BGDHI (4.43Mhz)   | preferred Standard is NTSC-Japan (3.58MHz, no 7.5 IRE-Offset) |              | 100                 |                  |
| preferred Standard is SECAM   | preferred Standard is NTSC M (3.58MHz)                        |              | 101                 |                  |
| reserved  | reserved  |              | 110                 |                  |
| reserved  | reserved  |              | 111                 |                  |
| Note: The meaning of "preferred standard" is, that the internal search machine will always give priority to the selected standard, thus the recognition time for these standards is kept short. |   |              |                     |                  |

| FUNCTION  | NAME | LOGIC LEVELS | DATA BITS |
|---|------|--------------|-----------|
| <b>Clear DTO (CDTO)</b>   |      |              |           |
| Disabled  | CDTO | 0            | D7        |
| <p>Every time CDTO is set, the internal subcarrier DTO phase is reset to 0° and the RTCO output generates a logic 0 at time slot 68. So an identical subcarrier phase can be generated by an external device (e.g. an encoder). The DTO-reset takes also care that the internal remodulation carrier's phase aligned to the internal demodulation phase.</p> <p>A DTO-reset must be initiated after reprogramming the color standard CSTD in non auto mode.</p> <p>However, if automatic standard searching mode is activated via AUTO[1:0] &lt;&gt; 00 an internal DTO-reset is generated after change of standard. That means it is only necessary to generate a DTO reset after connection to an external encoder.</p> |      | 1            |           |

| Automatic colour killer enabled (recommended setting)   | 0                    |       |           |   |
| Colour forced on  | 1                    |       |           |   |

16.2.18 SUBADDRESS 12 RTS0/1 OUTPUT CONTROL

**Table 70** RTS0 output control (SA 12)

| FUNCTION   | LOGIC LEVELS |        |        |        |
|--|--------------|--------|--------|--------|
|  | D3 to D0     |        |        |        |
|  | RTSE03       | RTSE02 | RTSE01 | RTSE00 |
| <b>RTS0 OUTPUT CONTROL <sup>(1)</sup></b>  |              |        |        |        |
| tristate   | 0            | 0      | 0      | 0      |
| constant LOW   | 0            | 0      | 0      | 1      |
| CREF (13.5 MHz toggling pulse, see Figure 24 on page 48)   | 0            | 0      | 1      | 0      |
| CREF2 (6.75 MHz toggling pulse, see Figure 24 on page 48)  | 0            | 0      | 1      | 1      |
| HL (horizontal lock indicator), selectable via HLSEL (sub addr. 11h, bit 4):<br>HLSEL = 0: standard horizontal lock indicator<br>HLSEL = 1: fast horizontal lock indicator (use is not recommended for sources with unstable timebase e. g. VCR's)<br>0: unlocked<br>1: locked | 0            | 1      | 0      | 0      |
| VL (Vertical & horizontal lock)<br>0: unlocked<br>1: locked  | 0            | 1      | 0      | 1      |
| DL (Vertical & horizontal lock & color detected)<br>0: unlocked<br>1: locked   | 0            | 1      | 1      | 0      |
| reserved   | 0            | 1      | 1      | 1      |
| HREF horizontal reference signal: indicates 720 pixels valid data on the expansion port. The positive slope marks the beginning of a new active line. HREF is also generated during the vertical blanking interval, see Figure 24 on page 48                                   | 1            | 0      | 0      | 0      |
| HS, programmable width in LLC8 steps via HSB[7:0] and HSS[7:0] (sub addr. 06h and 07h), fine position adjustment in LLC2 steps via HDEL[1:0] (sub addr. 11h, bits 5:4), see Figure 24 on page 48)  | 1            | 0      | 0      | 1      |
| HQ (HREF gated with VGATE)   | 1            | 0      | 1      | 0      |
| reserved   | 1            | 0      | 1      | 1      |
| V123 (Vertical sync, see Figure 22 on page 46 and Figure 23 on page 47)  | 1            | 1      | 0      | 0      |
| VGATE (programmable via VSTA[8:0], VSTO[8:0] and VGPS, sub addresses 15h, 16h, and 17h)  | 1            | 1      | 0      | 1      |
| reserved   | 1            | 1      | 1      | 0      |
| FID (position programmable via VSTA[8:0], sub addresses 15h and 17h, see Figure 22 on page 46 and Figure 23 on page 47)  | 1            | 1      | 1      | 1      |

**Note**

1. The polarity of any signal on RTS0 can be inverted via RTP0 (sub address 11 bit 3).

**Table 71** RTS1 output control (SA 12)

| FUNCTION   | LOGIC LEVELS |        |        |        |

16.2.27 SUBADDRESS 1B MISC. CHROMA CONTROL

**Table 82** Automatic VCR/TV-Detection Threshold (SA 1B)

| AUTOMATIC VCR/TV-DETECTION THRESHOLD   | D7,D6     |
|--|-----------|
|  | ATVT[1:0] |
| very sensitive to phase errors => early switching to fast horizontal time constant | 00        |
| <b>recommended value</b>   | <b>01</b> |
| less sensitive to phase errors   | 10        |
| insensitive to phase errors => late switching to fast horizontal time constant     | 11        |

**Table 83** Automatic Color Limiter (SA 1B)

| AUTOMATIC COLOR LIMITER  | D1       |
|--|----------|
|  | ACOL     |
| disabled   | 0        |
| <b>active: reduces oversaturated color in case of nonstandard burst/picture_content relation (recommended)</b> | <b>1</b> |

**Table 84** Fast Sequence Correction (SA 1B)

| FAST PAL/SECAM SEQUENCE CORRECTION                                  | D0   |
|---|------|
|   | FSQC |
| sequence correction enabled once per field (recommended)            | 0    |
| to be used, if immediate (linewise) sequence correction is required | 1    |

16.2.28 SUBADDRESS 1C ENHANCED COMBFILTER CONTROL 1

**Table 85** Horizontal Difference Gain (SA 1C)

| HORIZONTAL DIFFERENCE GAIN                           | D7,D6     |
|--|-----------|
|  | HODG[1:0] |
| lowest luminance bandwidth at horizontal transients  | 00        |
| higher luminance bandwidth at horizontal transients  | 01        |
| <b>recommended value</b>                             | <b>10</b> |
| highest luminance bandwidth at horizontal transients | 11        |

**Table 86** Vertical Difference Gain (SA 1C)

| VERTICAL DIFFERENCE GAIN                           | D5,D4     |
|--|-----------|
|  | VEDG[1:0] |
| highest luminance bandwidth at vertical transients | 00        |
| lower luminance bandwidth at vertical transients   | 01        |
| <b>recommended value</b>                           | <b>10</b> |
| lowest luminance bandwidth at vertical transients  | 11        |

**Table 87** Median Filter Gain (SA 1C)

| MEDIAN FILTER GAIN                                   | D3,D2     |
|--|-----------|
|  | MEDG[1:0] |
| highest luminance bandwidth at high color saturation | 00        |
| lower luminance bandwidth at high color saturation   | 01        |
| <b>recommended value</b>                             | <b>10</b> |
| lowest luminance bandwidth at high color saturation  | 11        |

**Table 88** Combfilter Threshold (SA 1C)

| <b>COMB THRESHOLD</b>  | <b>D1,D0</b>     |
|--|------------------|
|  | <b>CMBT[1:0]</b> |
| lowest comb strength for signals containing small chrominance content  | 00               |
| <b>recommended value</b>   | <b>01</b>        |
| higher comb strength for signals containing small chrominance content  | 10               |
| highest comb strength for signals containing small chrominance content | 11               |

#### 16.2.29 SUBADDRESS 1D ENHANCED COMBFILTER CONTROL 2

**Table 89** Vertical Difference Threshold (SA 1C)

| <b>VERTICAL DIFFERENCE THRESHOLD</b>  | <b>D1,D0</b>     |
|---|------------------|
|   | <b>VEDT[1:0]</b> |
| highest comb strength for signals containing large vertical chrominance differences | 00               |
| <b>recommended value</b>  | <b>01</b>        |
| lower comb strength for signals containing large vertical chrominance differences   | 10               |
| lowest comb strength for signals containing large vertical chrominance differences  | 11               |

### 16.2.30 SUBADDRESSES 1E, 1F STATUS BYTES VIDEO DECODER (READ-ONLY REGISTER)

**Table 90** Status byte 1 video decoder (SA 1E)

| I <sup>2</sup> C-BUS CONTROL BITS | FUNCTION   | DATA BIT |
|-----------------------------------|--|----------|
| DCSTD[1:0]                        | detected color standard:<br>00: No color [BW]<br>01: NTSC<br>10: PAL<br>11: SECAM            | D1, D0   |

| GLIMB                             | gain value for active luminance channel is limited [min (bottom)]; active HIGH               | D3       |
| GLIMT                             | gain value for active luminance channel is limited [max (top)]; active HIGH                  | D4       |
| SLTCA                             | slow time constant active in WIPA-mode; active HIGH  | D5       |
| HLCK                              | status bit for locked horizontal frequency; LOW = locked, HIGH = unlocked                    | D6       |
| NFLD                              | status bit for field length;<br>LOW = nonstandard field length, HIGH = standard field length | D7       |

**Table 91** Status byte 2 video decoder (SA 1F)

| I <sup>2</sup> C-BUS CONTROL BITS | FUNCTION  | DATA BIT |
|-----------------------------------|---|----------|
| RDCAP                             | Ready for Capture (all internal loops locked); active HIGH  | D0       |
| COPRO                             | Copy protected source detected according to Macrovision version up to 7.01  | D1       |
| COLSTR                            | Macrovision encoded Colorstripe burst detected (any type)   | D2       |
| TYPE3                             | Macrovision encoded Colorstripe burst type 3 (4 line version) detected  | D3       |
| STTB                              | status bit for timebase of input signal;<br>LOW = nonstable timebase (e.g. VCR)<br>HIGH = stable timebase (e.g. broadcast/DVD-source) | D4       |
| FIDT                              | identification bit for detected field frequency; LOW = 50 Hz, HIGH = 60 Hz  | D5       |
| HLVLN                             | status bit for horizontal and vertical loop: LOW = both loops locked,<br>HIGH = unlocked  | D6       |
| INTL                              | status bit for interlace detection, LOW = non interlaced, HIGH = interlaced   | D7       |

### 16.3 Programming Register Audio Clock Generation

See equations in chapter 8.6 and examples on Table 28 on page 83, Table 30 on page 85 and Table 31 on page 87

#### 16.3.1 SUBADDRESSES 30 TO 32 AMCLK CYCLES PER FIELD

**Table 92** Audio Master Clock: cycles per field (SA 30, SA 31, SA 32)

| AUDIO MASTER CLOCK:<br>CYCLES PER FIELD | CONTROL BITS D7 to D0 |        |        |        |        |        |        |        |
|---|-----------------------|--------|--------|--------|--------|--------|--------|--------|
| SA 30                                   | ACPF7                 | ACPF6  | ACPF5  | ACPF4  | ACPF3  | ACPF2  | ACPF1  | ACPF0  |
| SA 31                                   | ACPF15                | ACPF14 | ACPF13 | ACPF12 | ACPF11 | ACPF10 | ACPF9  | ACPF8  |
| SA 32                                   |                       |        |        |        |        |        | ACPF17 | ACPF16 |

#### 16.3.2 SUBADDRESSES 34 TO 36 AMCLK NOMINAL INCREMENT

**Table 93** Audio Master Clock: nominal increment (SA 34, SA 53, SA 36)

| AUDIO MASTER CLOCK:<br>NOMINAL INCREMENT | CONTROL BITS D7 to D0 |        |        |        |        |        |        |        |
|--|-----------------------|--------|--------|--------|--------|--------|--------|--------|
| SA 34                                    | ACNI7                 | ACNI6  | ACNI5  | ACNI4  | ACNI3  | ACNI2  | ACNI1  | ACNI0  |
| SA 35                                    | ACNI15                | ACNI14 | ACNI13 | ACNI12 | ACNI11 | ACNI10 | ACNI9  | ACNI8  |
| SA 36                                    |                       |        | ACNI21 | ACNI20 | ACNI19 | ACNI18 | ACNI17 | ACNI16 |

#### 16.3.3 SUBADDRESS 38 RATIO AMXCLK TO ASCLK

**Table 94** Clock ratio Audio Master Clock to Serial Clock (bit clock) ASCLK (SA 38)

| CLOCK RATIO AUDIO MASTER<br>CLOCK TO SERIAL CLOCK | CONTROL BITS D5 TO D0 |       |       |       |       |       |
|---|-----------------------|-------|-------|-------|-------|-------|
| SA 38   | SDIV5                 | SDIV4 | SDIV3 | SDIV2 | SDIV1 | SDIV0 |
|   | Refer to chapter 8.7  |       |       |       |       |       |

#### 16.3.4 SUBADDRESS 39 RATIO ASCLK TO ALRCLK

**Table 95** Clock ratio Serial Clock ASCLK to ALRCLK (channel select clock) (SA 39)

| CLOCK RATIO SERIAL CLOCK<br>ASCLK TO ALRCLK | CONTROL BITS D5 TO D0 |        |        |        |        |        |
|---|-----------------------|--------|--------|--------|--------|--------|
| SA 39                                       | LRDIV5                | LRDIV4 | LRDIV3 | LRDIV2 | LRDIV1 | LRDIV0 |
|   | Refer to chapter 8.7  |        |        |        |        |        |

### 16.3.5 SUBADDRESS 3A AUDIO CLOCK CONTROL

**Table 96** Audio clock control (SA 3A)

| FUNCTION   | NAME   | LEVELS | BITS |
|--|--------|--------|------|
| <b>ASCLK phase</b>   |        |        |      |
| ASCLK edges triggered by falling edges of AMCLK  | SCPH   | 0      | D0   |
| ASCLK edges triggered by rising edges of AMCLK   |        | 1      |      |
| <b>ALRCLK phase</b>  |        |        |      |
| ALRCLK edges triggered by falling edges of ASCLK   | LRPH   | 0      | D1   |
| ALRCLK edges triggered by rising edges of ASCLK  |        | 1      |      |
| <b>Audio Master clock Vertical Reference</b>   |        |        |      |
| Vertical reference pulse is taken from internal decoder  | AMVR   | 0      | D2   |
| Vertical reference is taken form XRV-input (expansion port)  |        | 1      |      |
| <b>Audio PLL mode</b>  |        |        |      |
| PLL active, AMCLK is frame-locked to the incoming video signal (Vertical reference pulse)  | APLL   | 0      | D3   |
| PLL open, AMCLK is free running  |        | 1      |      |
| <b>Audio PLL mode (only active if UCGC = 1)</b>  |        |        |      |
| internal Audio master clock is divided by 4  | CGCDIV | 0      | D6   |
| internal Audio master clock is divided by 3  |        | 1      |      |
| <b>Audio clock: CGC Generation mode</b>  |        |        |      |
| Second CGC (CGC2) bypassed (e.g. in case CGC2 is used for scaler backend clock generation): Audio clock as generated by the Audio PLL is output on pin AMCLK | UCGC   | 0      | D7   |
| Second CGC (CGC2) in use for Audio clock generation: Enhances the jitter, performance of the generated audio master clock on pin AMCLK                       |        | 1      |      |

## 16.4 Programming Register VBI data slicer

### 16.4.1 SUBADDRESS 40 BASIC SLICER SETTINGS

**Table 97** Amplitude searching (SA 40)

| Slicer Set (40h)                     | D4          |
|--------------------------------------|-------------|
| Amplitude searching                  | control bit |
|                                      | HUNT_N      |
| Amplitude searching active [default] | 0           |
| Amplitude searching stopped          | 1           |

**Table 98** Framing Code Error (SA 40)

| Slicer Set (40h)               | D5          |
|--------------------------------|-------------|
| Framing Code Error             | control bit |
|                                | FCE         |
| One framing code error allowed | 0           |
| No framing code errors allowed | 1           |

**Table 99** Hamming Check (SA 40)

| Slicer Set (40h)   | D6          |
|--|-------------|
| Hamming Check  | control bit |
|  | HAM_N       |
| Hamming check for 2 bytes after framing code, depending on data type [default] | 0           |
| No Hamming check   | 1           |

**Table 100**WSS-Check (SA 40)

| Slicer Set (40h)  | D7          |
|---|-------------|
| WSS525 CRC code check <sup>(1)</sup>  | control bit |
|   | CHKWSS      |
| All WSS525 packets are considered valid (provided that the start bit is detected), regardless of CRCERR | 0           |
| Only WSS525 packets with CRCERR = 0 are considered valid  | 1           |

- The VBI slicer will only track the amplitude of data that it considers to be valid; this tracking is important for optimal acquisition performance. If no valid data is found for several successive frames, then the slicer will enter amplitude searching (Hunting) mode until valid data is found again. CHKWSS alters the definition of "valid" data.  
Side effect if '1': if WSS525 data is present but containing incorrect CRC bits, the slicer will enter Hunting mode, and acquisition may intermittently fail even with an undistorted signal.  
Side effect if '0': if the slicer is set to acquire WSS525 from lines containing noise, or another data type, then false detections of "valid" data are more likely to occur which will upset the amplitude tracking mechanism. (Note that Hunting can still occur if the WSS525 start bits are never detected.)

#### 16.4.2 SUBADDRESS 41 TO 57 LINE CONTROL REGISTER

**Table 101** LCR Register 2...24 (SA41 .... SA57)

| LCR Register 2...24 (41h ...57h) <sup>(1)</sup> |  | D7..D4          | D3..D0          |
|---|--|-----------------|-----------------|
| 60HZ / 525 LINES STANDARDS                      | 50HZ / 625 LINES STANDARDS                   | DT[3:0] field 1 | DT[3:0] field 2 |
| do not acquire (active video)                   | do not acquire (active video)                | 0000            | 0000            |
| US Teletext (WST525)                            | Euro Teletext (WST625)                       | 0001            | 0001            |
| NABTS   | Euro Teletext with programmable Framing Code | 0010            | 0010            |
| Moji  | reserved                                     | 0011            | 0011            |
| US Closed Caption (CC525)                       | Euro Closed Caption (CC625)                  | 0100            | 0100            |
| CGMS (WSS525)                                   | Euro Wide Screen Signalling (WSS625)         | 0101            | 0101            |
| VITC525   | VITC625                                      | 0110            | 0110            |
| Gemstar2x                                       | VPS  | 0111            | 0111            |
| Gemstar1x                                       | reserved                                     | 1000            | 1000            |
| reserved  | reserved                                     | 1001            | 1001            |

| Open2 (5,7272 MHz)                              | Open2 (5,7272 MHz)                           | 1011            | 1011            |
| reserved  | reserved                                     | 1100            | 1100            |
| do not acquire (RAW)                            | do not acquire (RAW)                         | 1101            | 1101            |
| do not acquire (Test)                           | do not acquire (Test)                        | 1110            | 1110            |
| do not acquire (active video)                   | do not acquire (active video)                | 1111            | 1111            |

- Line Control Register LCR0 to LCR23 are assigned to one VBI dataline of a VBI region each. Line Control Register LCR24 is assigned to all other VBI data lines / active video lines.

#### 16.4.3 SUBADDRESS 58 PROGRAMMABLE FRAMING CODE

**Table 102** Framing Code for programmable Data Types (SA58)

| Slicer Set (580h)  | D7...0       |
|--|--------------|
| Framing Code for programmable Data Types according to the DT table | control bits |
|  | FC7...0      |
| [default]  | 40h          |

#### 16.4.4 SUBADDRESS 59 HORIZONTAL OFFSET

**Table 103** Horizontal Offset (SA 59, SA 5B)

| Slicer Set (59h, 5Bh) | 5Bh,D2...0   | 59h,D7...0   |
|-----------------------|--------------|--------------|
| Horizontal Offset     | control bits | control bits |
|                       | HOFF10...8   | HOFF7...0    |
| recommended value     | 3h           | 47h          |

#### 16.4.5 SUBADDRESS 5A VERTICAL OFFSET

**Table 104** Vertical Offset (SA 5A, SA 5B)

| Slicer Set (5Ah, 5Bh)   | 5Bh,D4      | 5Ah,D7...0   |
|---|-------------|--------------|
| Vertical Offset   | control bit | control bits |
|   | VOFF[8]     | VOFF[7:0]    |
| Minimum value 0   | 0           | 0            |
| Maximum value 312   | 1           | 38           |
| value for 50 Hz/625 lines input   | 0           | 03           |
| value for 60 Hz/525 lines input and ITU656 line counting <sup>(1)</sup> | 0           | 06           |
| value for 60 Hz/525 lines input and consistent field ID <sup>(1)</sup>  | 0           | 03           |

1. for 60 Hz offsets; please refer to sect.8.2 and sect.8.4

#### 16.4.6 SUBADDRESS 5B FIELD OFFSET, MSB's H/V-OFFSETS

**Table 105** Field Offset, MSB's for Vertical and Horizontal Offsets (SA 5B)

| Slicer Set (5Bh)   | D5          |
|--|-------------|
| Vertical Trigger Edge  | control bit |
|  | VEP         |
| VBI slicer triggers on the negative edge of the internal V123 V-sync (Default) | 0           |
| VBI slicer triggers on the positive edge of the internal V123 V-sync           | 1           |

**Table 106** Field Offset, MSB's for Vertical and Horizontal Offsets (SA 5B)

| <b>Slicer Set (5Bh)</b>   | <b>D7</b>          |
|---|--------------------|
| <b>Field Offset</b>   | <b>control bit</b> |
|   | <b>FOFF</b>        |
| no modification of internal field indicator,<br>(default for 50 Hz/625 lines input sources) | 0                  |
| Invert field indicator<br>(default for 60 Hz/525 lines input sources)                       | 1                  |

16.4.7 SUBADDRESS 5D: SLDOM CODES

**Table 107** Sliced data output modes (SA 5D)

| Slicer Set (5Dh)   | D4     | D3     | D2               | D1     | D0     |
|--|--------|--------|------------------|--------|--------|
| Sliced Data Output Mode  | SLDOM4 | SLDOM3 | SLDOM2           | SLDOM1 | SLDOM0 |
| Output from VBI slicer through I-port is disabled (VITX[1] function of SAA7114)  | X      | 0      | 0                | 0      | 0      |
| no recoding  | X      | X      | X                | X      | 0      |
| recode data values 00h and FFh to even parity values 03h and FCh   | X      | X      | X                | X      | 1      |
| ANC header with constant DID byte, programmable via SDID (addr. 5Eh)   | X      | 0      | 0                | 1      | X      |
| ANC header (VIP-DID) for DT 1 - 8, A and B plus timing codes (empty packages) for lines 1 and after line 23  | X      | 0      | 1                | 0      | X      |
| ANC header (VIP-DID) for DT 1 - 8, A and B no timing codes   | X      | 0      | 1                | 1      | X      |
| SAV-EAV framed output lines, with D2 as T-Bit of SAV/EAV byte  | X      | 1      | T <sup>(1)</sup> | X      | X      |
| SAV-EAV framing for the defined VBI standards of DT 1 - 8, A and B and DT 9  | X      | 1      | T <sup>(1)</sup> | 0      | X      |
| SAV-EAV framing for the defined VBI standards except for those Data Types which are accessible via I2C readback registers. Suppressed standards are: CC525/625, WSS525/625 (CGMS), Gemstar1x/Gemstar2x | X      | 1      | T <sup>(1)</sup> | 1      | X      |
| if regions overlap, output of sliced VBI and scaled video for a certain line   | 0      | 1      | T <sup>(1)</sup> | X      | X      |
| if regions overlap, output of video is suppressed for SAV-EAV framed sliced VBI lines  | 1      | 1      | T <sup>(1)</sup> | X      | X      |

1. corresponds to the T-Bit of SAV/EAV codes

#### 16.4.8 SUBADDRESS 5E SDID CODES

**Table 108** SDID codes (SA 5E)

| Slicer Set (5Eh)        | D5           | D4           | D3           | D2           | D1           | D0           |
|-------------------------|--------------|--------------|--------------|--------------|--------------|--------------|
| <b>SDID codes</b>       | <b>SDID5</b> | <b>SDID4</b> | <b>SDID3</b> | <b>SDID2</b> | <b>SDID1</b> | <b>SDID0</b> |
| SDID5..0 = 0h [default] | 0            | 0            | 0            | 0            | 0            | 0            |

#### 16.4.9 SUBADDRESS 5E (READ-ONLY REGISTER)

**Table 109** Slicer Status Bit (SA 5E), read only

| Slicer Status Bit (5Eh) read only                    | D7                 |
|--|--------------------|
| <b>Framing Code Valid</b>                            | <b>control bit</b> |
|  | <b>FC8V</b>        |
| No Framing code (0 error) in the last frame detected | 0                  |
| Framing code with 0 error detected                   | 1                  |

**Table 110** Slicer Status Bit (SA 5E), read only

| Slicer Status Bit (5Eh) read only                    | D6                 |
|--|--------------------|
| <b>Framing Code Valid</b>                            | <b>control bit</b> |
|  | <b>FC7V</b>        |
| No Framing code (1 error) in the last frame detected | 0                  |
| Framing code with 1 error detected                   | 1                  |

16.4.10 SUBADDRESS 66 TO 7F I<sup>2</sup>C READBACK OF DECODED VBI DATA (READ-ONLY REGISTER)

16.4.10.1 Subaddress 66 to 6A I<sup>2</sup>C Readback of Closed Caption Data (CC525 and CC625) (read-only register)

**Table 111** Closed Caption (CC525 and CC625) I<sup>2</sup>C readback (66h, ... , 6Ah) read only

| Register Content <sup>(1)</sup>      | REG. ADDR. | D7               | D6             | D5            | D4             | D3 .. D0                   |
|--------------------------------------|------------|------------------|----------------|---------------|----------------|----------------------------|
| Status Header                        | 66 h       | CCH_7            | CCH_6          | CCH_5         | CCH_4          | CCH_3 .. CCH_0             |
|                                      |            | odd field        |                | even field    |                | free running field counter |
|                                      |            | being updated    | data erroneous | being updated | data erroneous |                            |
| CC payload data byte 1 of odd field  | 67 h       | CCO1_7 .. CCO1_0 |                |               |                |                            |
| CC payload data byte 2 of odd field  | 68 h       | CCO2_7 .. CCO2_0 |                |               |                |                            |
| CC payload data byte 1 of even field | 69 h       | CCE1_7 .. CCE1_0 |                |               |                |                            |
| CC payload data byte 2 of even field | 6A h       | CCE2_7 .. CCE2_0 |                |               |                |                            |

- All decoded VBI data is written into the registers starting with the LSB of each register first until all data is stored

**Table 112** Closed Caption (CC525 and CC625) data order in WSS I<sup>2</sup>C readback registers

| Register Name                | CCO1 / CCE1 |     |     |     |     |     |     |     | CCO2 / CCE2 |     |     |     |     |     |     |     |
|------------------------------|-------------|-----|-----|-----|-----|-----|-----|-----|-------------|-----|-----|-----|-----|-----|-----|-----|
| Register Addr.               | 6C h / 6F h |     |     |     |     |     |     |     | 6D h / 70 h |     |     |     |     |     |     |     |
| Register Bit                 | D 7         | D 6 | D 5 | D 4 | D 3 | D 2 | D 1 | D 0 | D 7         | D 6 | D 5 | D 4 | D 3 | D 2 | D 1 | D 0 |
| CC525 Bit No. <sup>(1)</sup> | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| CC625 Bit No. <sup>(1)</sup> | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |

- CC data bits in order they appear in the VBI data line (beginning with bit 0)

16.4.10.2 Subaddress 6B to 71 I<sup>2</sup>C Readback of Closed Caption Data (WSS525 and WSS625) (read-only register)

**Table 113** Widescreen Signalling (WSS525 and WSS625) I<sup>2</sup>C readback (6Bh, ... , 71h) read only

| REGISTER CONTENT <sup>(1)</sup>       | REG. ADDR. | D7                 | D6             | D5            | D4             | D3 .. D0                   |
|---------------------------------------|------------|--------------------|----------------|---------------|----------------|----------------------------|

- WSS525 data bits in order they appear in the VBI data line (beginning with bit 1)
- This bit carries the result of the CRC-check. It is '0' if the received CRC code is identical to the calculated CRC Code, else it is set to '1'
- WSS625 data bits in order they appear in the VBI data line (beginning with bit 0)

16.4.10.3 Subaddress 72 to 76 I<sup>2</sup>C Readback of Gemstar1x Data (read-only register)

## 16.6 Programming Register - second PLL (PLL2) and Pulse Generator

### 16.6.1 SUBADDRESS F0 TO F5 AND FF: SECOND PLL (PLL2) PROGRAMMING PARAMETERS

**Table 170** Number of LFCO cycles (= number of clock cycles divided by 4) per line (SA F0, SA F1)

| SECOND PLL REGISTER SET (F0H, F1H)  | F1 h, D0   | F0 h, D7...0     |
|---|--|------------------|
|   | SPLPL8   | SPLPL7 .. SPLPL0 |
| Number of LFCO cycles per line<br>(= number of target clock cycles per line divided by 4) |  |                  |
| Target Clock Frequency = 29,5 MHz<br>(625 lines per frame)                                | 1D8 h  |                  |
| Target Clock Frequency = 24,5454 MHz<br>(525 lines per frame)                             | 186 h  |                  |
| Target Clock Frequency = 27 MHz<br>(625 lines per frame)                                  | 1B0 h  |                  |
| Target Clock Frequency = 27 MHz<br>(525 lines per frame)                                  | 1AD h  |                  |
| Calculation Formula:  | $SPLPL[8:0] = (\text{number of target clock cycles per line}) / 4$ |                  |

**Table 171** Selecting the source of horizontal reference signal for the second PLL (PLL2) (SA F1)

| Second PLL Register Set (F1 h)  | D1     |
|---|--------|
| second PLL (PLL2) horizontal reference signal source                          | SPHSEL |
| The combfilter decoder is selected as horiz. sync. source.                    | 0      |
| The XRH signal of the X-Port (input mode) is selected as horiz. sync. source. | 1      |

**Table 172** Selecting the operation mode of the second PLL (PLL2) (SA F1)

| Second PLL Register Set (F1 h)   | D3            | D2            |
|--|---------------|---------------|
| <b>second PLL (PLL2) operation mode</b>  | <b>SPMOD1</b> | <b>SPMOD1</b> |
| Synthesize Clock:<br>The generated (CGC2) frequency depends on the nominal increment (SPNINC) only. The contribution of the loop filter is disabled. The I and P proportion of the loop filter is set to zero. | 0 0           |               |
| PLL-closed (normal operation mode):<br>This is the normal operation mode of the second PLL (PLL2): the nominal increment plus the content of loop filter define the output (CGC2) frequency.                   | 0 1           |               |
| PLL-hold:<br>The PLL keeps the last frequency before entering this mode. The content of the loop filter will be frozen.  | 1 0           |               |
| PLL-Re-Sync (pll_mode = 11)<br>The phase detector is constantly re-synchronized to the horizontal reference signal. The remaining phase error is fed into the loop filter.                                     | 1 1           |               |

**Table 173** Loopfilter mode of the second PLL (PLL2) (SA F1)

| Second PLL Register Set (F1 h)   | D7 .. D4               |
|--|------------------------|
| <b>second PLL (PLL2) Loop Filter mode (P- / I-Parameter selection)</b> | <b>SPPI3 .. SPPI 0</b> |
| Default adaptive mode (recommended)                                    | 0000                   |
| Fast mode  | 0001                   |
| reserved   | 0002                   |
|  | ...                    |
|  | 1101                   |
| Medium mode  | 1110                   |
| Slow mode  | 1111                   |

**Table 174** Nominal DTO increment (SA F2, SA F3)

| SECOND PLL REGISTER SET (F2 H, F3 H)  | CRYSTAL CLOCK FREQUENCY | F3 h, D7 .. D0  | F2 h, D7.. 0       |
|---|-------------------------|---|--------------------|
|   |                         | SPNINC15 .. SPNINC8   | SPNINC7 .. SPNINC0 |
| <b>Nominal Increment for the DTO of the second PLL (PLL2)</b>                         |                         |   |                    |
| Target Clock Frequency = 29,5 MHz   | 32.11 MHz               | 3ACC h  |                    |
|   | 24.576 MHz              | 4CD2 h  |                    |
| Target Clock Frequency = 24,545 MHz   | 32.11 MHz               | 30EC h  |                    |
|   | 24.576 MHz              | 3FEB h  |                    |
| Target Clock Frequency = 27 MHz   | 32.11 MHz               | 35D0 h  |                    |
|   | 24.576 MHz              | 4650 h  |                    |
| Calculation Formula for the nominal increment depending on the Target Clock Frequency | XTALFREQ                | integer of<br>( (Target Clock Frequency) / ( 4 * XTALFREQ ) * 2 <sup>16</sup> ) |                    |

**Table 175** Lock Status of the second PLL (PLL2) (SA F4)

| Second PLL Register Set (F4 H)              | D0            |
|---|---------------|
| <b>Lock Status of the second PLL (PLL2)</b> | <b>SPLOCK</b> |
| second PLL (PLL2) un-locked                 | 0             |
| second PLL (PLL2) locked                    | 1             |

**Table 176** Maximum Phase Error Threshold for lock detection of the second PLL (PLL2) (SA FF)

| Second PLL Register Set (FF h)   | D3 .. D0                  |
|--|---------------------------|
| <b>Maximum Phase Error Threshold for lock detection of the second PLL (PLL2)</b> | <b>SPTHRM3 .. SPTHRM0</b> |
| Maximum Phase Error >= 0 %   | 0000                      |
| Maximum Phase Error >= 6.25 %  | 0001                      |
| Maximum Phase Error >= 12.5 %  | 0010                      |
| Maximum Phase Error >= 18.75 %   | 0011                      |
| Maximum Phase Error >= 25 %  | 0100                      |
| Maximum Phase Error >= 31.5 %  | 0101                      |
| Maximum Phase Error >= 37.5 %  | 0110                      |

| 111 lines  | 1101                      |
| 119 lines  | 1110                      |
| 127 lines  | 1111                      |

16.6.2 SUBADDRESS F6 TO FB: PULSE GENERATOR PROGRAMMING

**Table 178** Number of LFCO cycles (= number of clock cycles divided by 4) per line (SA F5, SA F6)

| PULSE GENERATOR REGISTER SET (F5H, F6H)   | F6 h, D0  | F5 h, D7...0     |
|---|---|------------------|
|   | PGLEN8  | PGLEN7 .. PGLEN0 |
| This setting must be equal to the number of LFCO cycles per line since it defines the output line length at the I-port when driven by the Pulse Generator |   |                  |
| Target Clock Frequency = 29,5 MHz<br>(625 lines per frame)  |   | 1D8 h            |
| Target Clock Frequency = 24,5454 MHz<br>(525 lines per frame)   |   | 186 h            |
| Target Clock Frequency = 27 MHz<br>(625 lines per frame)  |   | 1B0 h            |
| Target Clock Frequency = 27 MHz<br>(525 lines per frame)  |   | 1AD h            |
| Calculation Formula:  | PGLEN[8:0] = (number of target clock cycles per line) / 4 |                  |

**Table 179** Selecting the source of horizontal reference signal for the PULSE Generator (SA F6)

| <b>PULSE Generator Register Set (F6 H)</b>                                       | <b>D1</b>     |
|--|---------------|
| <b>PULSE Generator horizontal reference signal source for re-synchronisation</b> | <b>PGHSEL</b> |
| The combfilter decoder is selected as horiz. sync. source.                       | 0             |
| The XRH signal of the X-Port (input mode) is selected as horiz. sync. source.    | 1             |

**Table 180** Resetting (Resynchronizing) the PULSE Generator to a horizontal synchronisation event. (SA F6)

| <b>PULSE Generator Register Set (F6 H)</b>   | <b>D2</b>    |
|--|--------------|
| <b>PULSE Generator horizontal reference signal source for re-synchronisation</b>   | <b>PGRES</b> |
| The Pulse generator is in free running mode.   | 0            |
| Software reset/resync for the Pulse Generator. The internal counter and thus all generated signals (Pulse A trigger, Pulse B trigger and Pulse C trigger) will be resynchronized to the incoming horiz. sync. source (defined by PGHSEL) as long as pulse_gen_res is programmed to '1' | 1            |

**Table 181** Pulse C trigger position for Task A (SA F6, SA F7)

## 17 PROGRAMMING START SET-UP

### 17.1 Decoder part

The given values force the following behaviour of the SAA7115 video decoder part:

- Analog input conditions: NTSC M, PAL B, D, G, H, I or SECAM signal in CVBS format on input AI11(column 1) or Y/C-format on inputs AI11, AI21 (column 2)
- Analog anti-alias filter and AGC active
- Automatic field detection enabled
- Automatic TV/VCR detection enabled
- Automatic color standard detection enabled (column 1 and 2: Auto mode 3: predefined filters, sharpness control disabled)
- Standard ITU 656 output format enabled on expansion (X) port, see also subaddress 83h (X-port control)
- Contrast, brightness and saturation control in accordance with ITU standards
- Adaptive comb filter for luminance and chrominance activated
- Pins LLC, LLC2, XTOUT, RTS0, RTS1 and RTCO are set to 3-state
- I-port (scaled video-output) and audio clock generation are disabled (lower power consumption), see corresponding sections to activate their functionality.
- Columns 3 to 5 are examples for typical settings in non auto mode.

**Table 184** Decoder part start set-up values for auto mode and the three main standards

**Note**

1. All "X" values must be set to logic 0.

## 17.2 Audio clock generation part

The given values force the following behaviour of the SAA7115 audio clock generation part:

- Used crystal is 24.576 MHz
- Expected field frequency is 59.94 Hz (e.g. NTSC M standard)
- Generated audio master clock frequency at pin AMCLK is  $256 \times 44.1 \text{ kHz} = 11.2896 \text{ MHz}$
- AMCLK is frame-locked to the incoming video signal
- AMCLK is directly generated by the audio clock PLL, no CGC2 is used
- AMCLK is externally connected to AMXCLK [short-cut between pins 37 and 41]
- ASCLK (bit clock) =  $32 \times 44.1 \text{ kHz} = 1.4112 \text{ MHz}$
- ALRCLK (word select) is 44.1 kHz.

### Note

1. All "X" values must be set to logic 0.
2. See also chapter 8.7: "Audio clock generation (subaddresses 30H to 3FH)" for more examples.

### 17.3 Data slicer and data type control part

The given values force the following behaviour of the SAA7115 VBI-data slicer part:

- Closed captioning data are expected at line 21 of field 1 (60 Hz/525 line system)
- All other lines are processed as active video
- Sliced data are framed by ITU 656 like SAV/EAV sequence, no re-coding of data bytes.
- Sliced data packages for all defined vbi standards, see Table 107: "Sliced data output modes (SA 5D)"
- example for ITU656 correct line counting, field ID of VBI slicer is swapped (see 8.2 and 8.4)

**Table 186** Data slicer start set-up values

#### 17.4 Scaler and interfaces

Table 187 shows some examples for the scaler programming with:

- prsc = prescale ratio
- fisc = fine scale ratio
- vsc = vertical scale ratio.

The ratio is defined as:  $\frac{\text{number of input pixel}}{\text{number of output pixel}}$

In the following settings the VBI-data slicer is inactive. To activate the VBI-data slicer, SLDOM 5DH[4:0] has to be set to > '00H'.

To compensate the running-in of the vertical scaler, the vertical input window lengths are extended by 2 to 290 lines, respectively 242 lines for XS, but the scaler increment calculations are done with 288, respectively 240 lines.

##### Trigger condition

For trigger condition STRC[1:0]90H[1:0] not equal '00'.

If the value of (YO + YS) is greater equal 262 (NTSC), respectively 312 (PAL) the output field rate is reduced to 30 Hz, respectively 25 Hz.

Horizontal and vertical offsets (XO and YO) have to be used to adjust the displayed video in the display window. As this adjustment is application dependent, the listed values are only dummy values.

##### Maximum zoom factor

The maximum zoom factor is dependent on the back-end data rate and therefore back-end clock and data format dependent (8 or 16-bit output). The maximum horizontal zoom is limited to about 3.5, due to internal data path restrictions.

#### 17.4.1 EXAMPLES

**Table 187** Example configurations

| EXAMPLE NUMBER | SCALER SOURCE AND REFERENCE EVENTS  | INPUT WINDOW | OUTPUT WINDOW | SCALE RATIOS                               |

### 17.5 PLL2 and pulse generator control part

The given values force the following behaviour of the SAA7115 PLL2 clock and pulse generation part, where the pulse generation values are for 8 bit I-port output with ITU like code sequences:

- Example 1:
  - PLL2 - synthesis of line locked square pixel clock of 24.545454 MHz from 24.576 MHz crystal
  - pulse generator - pulse generation for 1560 clock cycles per line and video (640 pixel=1288 bytes) from page A and raw data (1448 bytes) from page B, no deep buffering, delay only used for EAV alignment, VBI stream as timing master
  - a corresponding scaler programming (only for page A) can be found in sect. 17.4 , Example 2
- Example 2:
  - PLL2 - synthesis of line locked square pixel clock of 29.5 MHz from 32.11 MHz crystal
  - pulse generator - pulse generation for 1888 clock cycles per line and video A (768 pixel=1544 bytes) + sliced VBI, EAV aligned, medium pixel buffering, PGHCPS somewhere in the allowed range
  - a corresponding scaler programming can be found in sect. 17.4 , Example 3
- PLL2 in normal operation (SPMOD[1:0] = '01') for all examples
- for 32.11 Mhz crystal (external strapping resistor required)

**Table 189** PLL2 and pulse generator start set-up values

| FB                | Pulse C position (MSB's)   | PGHCPS11 to PGHCPS4                            | 60        |       | 12        |       |
| FC to FE          | reserved   | X, X, X, X, X, X, X, X                         | 00        | 0     | 00        | 0     |
| FF                | PLL locking thresholds   | SPTHRL3 to SPTHRO, SPTHRM3 to SPTHRO           | 88        | 136   | 88        | 136   |

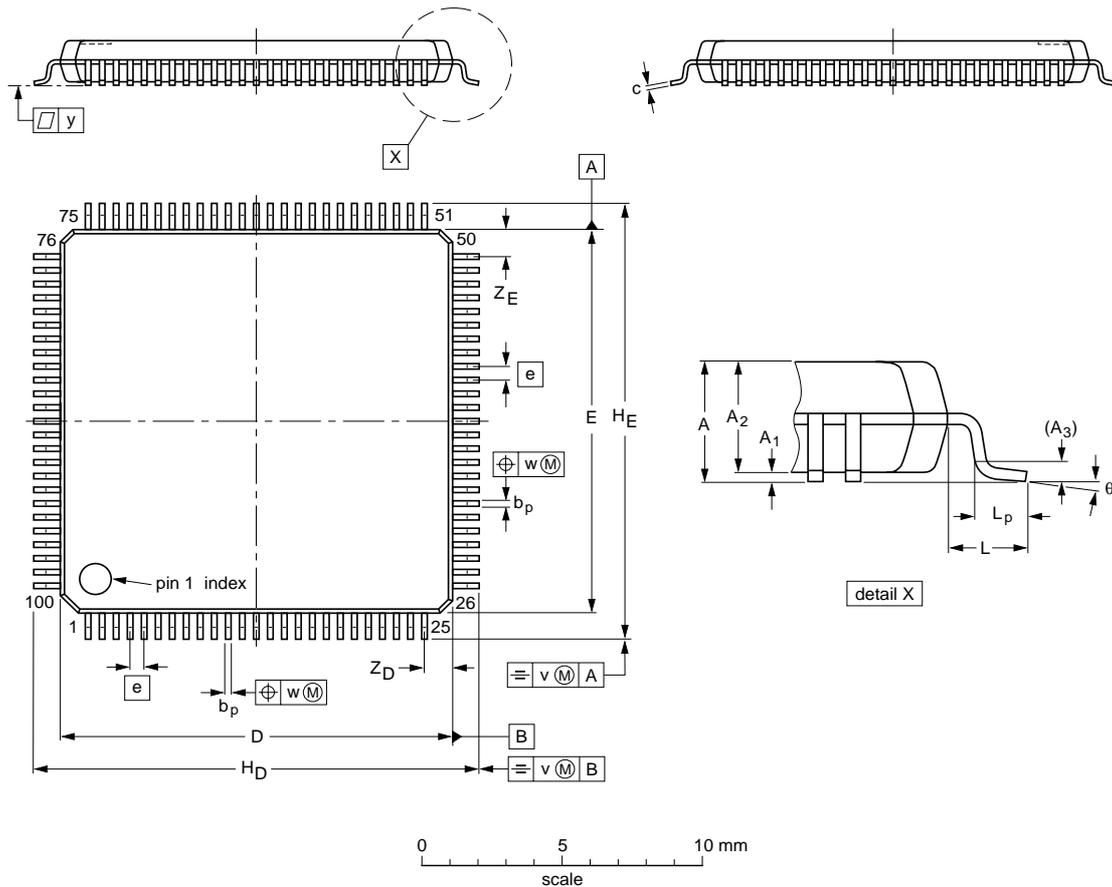

**Notes**

1. All X values must be set to logic 0.
2. max. values for pulse positions are 4 x PGLEN[8:0], e.g. PGLEN = 429, PGHxPS max = 1716.
3. the position counter starts with count '1', for the value of '0' no trigger pulses are generated
