Note: Node address 0 is used for messaging between nodes and must not be used.
 A total of 255 node address settings are available. The switches are a binary representation of the decimal node addresses. Switch 8 is the Least Significant Bit and switch 1 is the Most Significant Bit. The switches have the following decimal values: switch 8=1, 7=2, 6=4, 5=8, 4=16, 3=32, 2=64, 1=128. Turn on the switches and add the values of the on switches to obtain the correct node address. (On=1, Off=0)

RIM BUFFER ADDRESS CONFIGURATION							
Buffer Address	SW1/2	SW1/3	SW1/4	SW1/5	SW1/6	SW1/7	SW1/8
xC000h	Off	On	On	Off	Off	Off	Off
xC400h	Off	On	On	Off	Off	Off	On

xD800h	Off	On	On	Off	On	On	Off
xDc00h	Off	On	On	Off	On	On	On
xE000h	Off	On	On	On	Off	Off	Off

Notes: Place one digit from the following table in front of the address given above to get the complete Address.
Address xC000h must be used when the RIM buffer is set to use 128KB, rather than 16KB.
SW3/switch 4 should be set to On for 128KB, or Off for 16KB.

RIM BUFFER EXTENDED ADDRESS CONFIGURATION							
Segment	SW3/1	SW3/2	SW3/3	SW3/5	SW3/6	SW3/7	SW3/8

Dxxxh	On	Off	Off	On	On	Off	On
Exxxh	On	Off	Off	On	On	On	Off
Fxxxh	On	Off	Off	On	On	On	On

Note: Place the digit found in this table in front of the address given on the previous table to get the complete RIM buffer address. A setting other than zero in this table will place the buffer into extended memory at the aforementioned address. For example, a setting of 2 will place the buffer into the 2nd megabyte of extended memory, a setting of C will place the buffer into the 12th megabyte of extended memory. Starting from the base address, make sure that the next 16 to 128KB of memory (see above notes) are not used.
Important: The software drivers supplied with this card do not support extended memory.
