Introduction

Welcome to the ROCKY-548TX Pentium® Single Board Computer. The ROCKY-548TX board is an ISA/PCI form factor board, which comes equipped with high performance Pentium® CPU and advanced high performance multi-mode I/O, designed for the system manufacturers, integrators, or VARs that want to provide all the performance, reliability, and quality at a reasonable price.

This board built-in DiskOnChip™(DOC) Flash Disk for embedded application. The DOC Flash Disk is 100% compatible to hard disk. User can use any DOS command without any extra software utility. The DOC currently is available from 2MB to 72MB.

An advanced high performance super AT I/O chip – Winbond W83977TF is used in the ROCKY-538TXV board. Both on-chip UARTs are compatible with the NS16C550. The parallel port and IDE interface are compatible with IBM PC/AT and XT architecture's.

In addition, the ROCKY-548TX Ver. 6.x provides two 168-pin DIMM sockets for its on-board DRAM. The RAM module accepts 8MB, 16MB, 32MB, 64MB or 128B. So, the total on-board memory can be configured from 16MB to 256MB.

ROCKY-548TX uses the advanced INTEL Chipset, 430TX which is 100% ISA/PCI compatible chipset with PCI 2.1 standard.

1.1 Specifications :

The ROCKY-548TX Pentium® Single Board Computer provides the following specification:

- **CPU** : Pentium® MMX up to 233Mhz, AMD K6 processor up to 300MHz, Cyrix 6x86MX processor
- **Bus** : ISA bus and PCI 32-bit local bus,PCI 2.1 standard
- **DMA channels** : 7
- **Interrupt levels** : 15
- **Chipset** : Intel 430TX
- **Real-time clock/calendar** : in 430TX chipset,backup by industrial Li-battery,3V/850mAH. .
- **RAM memory** : up to 256MB,SDRAM supported
- **Second Cache memory** : 512KB Pipelined Burst SRAM on board
- **Ultra DMA/33 IDE Interface** : up to four PCI Enhance IDE hard drives. The Ultra DMA/33 IDE can handle data transfer up to 33MB/s. The best of all is that is new technology is compatible with existing ATA-2 IDE specifications. So there is no need to do any change for customer's current accessory.
- **Floppy disk drive interface** : two 2.88 MB, 1.44MB, 1.2MB, 720KB, or 360KB floppy disk drives.
- **Two high speed Series ports** : NS16C550 compatible UARTs
- **Bi-directional Parallel Port**
- **IrDA port** : Support Serial Infrared(SIR) and Amplitude Shift Keyed IR(ASKIR) interface.
- **USB port** : Support two USB ports for future expansion.
- **Watch-dog timer** : can be set by 1,2,10,20,110 or 220 seconds period. Reset or NMI was generated when CPU did not periodically trigger the timer. Your program use hex 043 and 443 to control the watch-dog and generate a system reset.

- **Flash Disk - DiskOnChip™** : The Flash Disk provide 100% compatible with hard disk. The built-in TrueFFS Transparent Flash Block Management and Space Reclamation will let customer to use the Flash Disk with DOS command, no need any extra software utility.
- **Keyboard connector**
- **Mouse** : PS/2 Mouse Port on-board.
- **Power Consumption** : +5V @ 4.5A
(Pentium/MMX-200,32MB SDRAM)
+12V @ 170mA , -12V@20mA
- **Operating Temperature** : 0° ~ 55° C (CPU needs Cooler)

1.2 What You Have

In addition to this *User's Manual*, the ROCKY-548TX package includes the following items:

- ROCKY-548TX Pentium® Single Board Computer
- Printer Cable
- FDD/HDD Cable

If any of these items is missing or damaged, contact the dealer from whom you purchased the product. Save the shipping materials and carton in case you want to ship or store the product in the future.

Installation

This chapter describes how to install the ROCKY-548TX. At first, the layout of ROCKY-548TX is shown, and the unpacking information that you should be careful is described. The jumpers and switches setting for the ROCKY-548TX's configuration, such as CPU type selection, system clock setting, and watch dog timer, are also included.

2.1 ROCKY-548TX Ver. 6.x Layout

2.2 Unpacking

Your ROCKY-548TX Single Board Computer contains sensitive electronic components that can be easily damaged by static electricity.

In this section, we describe the precautions you should take while unpacking, as well as during installation. It is very important that the instructions be followed correctly, to avoid static damage, and to successfully install the board.

The system board should be done on a grounded anti-static mat. The operator should be wearing an anti-static wristband, grounded at the same point as the anti-static mat.

Inspect the cardboard carton for obvious damage. Shipping and handling may cause damage to your board. Be sure there are no shipping and handling damages on the board before processing.

After opening the cardboard carton, exact the system board and place it only on a grounded anti-static surface component side up.

Again inspect the board for damage. Press down on all the socketed IC's to make sure that they are properly seated. Do this only with the board place on a firm flat surface.

Note : DO NOT APPLY POWER TO THE BOARD IF IT HAS BEEN DAMAGED.

You are now ready to install your ROCKY-548TX Single Board Computer.

- CPU Core Voltage Selection :

Please check the CPU Core Voltage before you install the CPU. Right now new Intel MMX CPU is dual voltages for core and I/O, the I/O is 3.3V but the core is 2.8V. This kind of CPU design will enhance the low power consumption capability. As for the general Pentium CPU is one voltage for I/O and Core - 3.3V, 3.4V, or 3.5V

2.6 DiskOnChip™ Flash Disk

The DiskOnChip™ Flash Disk Chip(DOC) is produced by M-Systems. Because the DOC is 100% compatible to hard disk and DOS.Customer don't need any extra software utility. It is just "plug and play",easy and reliable. Right now the DOC is available from 2MB to 72MB.T There have four sockets for the DOC,thru the software utility customer can combine four DOCs as an HDD drive. Then the max. capacity will be 288MB.

Please contact <ftp.icpacquire.com.tw> or www.m-sys.com to get the software utility for the multi-DOC application.

2.7 Clear CMOS Setup

If want to clear the CMOS Setup(for example forgot the password you should clear the setup and then set the password again.),you should close the JP1 pin 2-3 about 3 seconds,then open again. Set back to normal operation mode,close pin 1-2.

• **JP1 : Clear CMOS Setup (Reserve Function)**

JP1	DESCRIPTION

2.8 Battery Backup for CMOS Setup

There have one 4-pin header CN8 using for battery backup function. When close the pin 1-2 will use the on board battery. When use external battery you should take off the jumper and use the connector as external battery connector.

• **CN8 : Battery Backup Function**

CN8	DESCRIPTION

2.9 BIOS Flash Chip Write Voltage Setting

The BIOS Flash Chip could be two types, one is 12V write voltage and other one is 5V.

- **JP14 : 5V/12V Flash Chip Write Voltage Setting**
(This jumper is factory setting ,customer may not change it)

3.8 External Battery Connector

The ROCKY-548TX built-in a 3V/850mAH industrial Li-battery for CMOS and RTC backup. When normal operation will not need external battery to backup the data. If want to connect the external battery you could take off the CN8 's pin 1-2 jumper. Then connect the external battery to pin 1-4.

3.10 IrDA Infrared Interface Port

The ROCKY-548TX built-in a IrDA port which support Serial Infrared(SIR) or Amplitude Shift Keyed IR(ASKIR) interface. When use the IrDA port have to set SIR or ASKIR model in the BIOS's Peripheral Setup's COM 2. Then the normal RS-232 COM 2 will be disabled.

3.11 Fan Connector

The ROCKY-548TX provides CPU cooling fan connector, chassis fan connector. These connectors can supply 12V/500mA to the cooling fan. In the connector there have a “rotation” pin . The rotation pin is to get the fan’s rotation signal to system. So the system BIOS could recognize the fan speed. Please note only specified fan offers the rotation signal.

3.13 ATX Power Switch / Soft Power Switch Connector

When use the ATX power supply the system power is controlled by a momentary switch connected to this connector . Push the button once will switch the system between ON and SLEEP. Pushing the switch while in the ON mode for more than 4 seconds will turn the system OFF. The system power LED shows the status of the system's power.

AWARD BIOS Setup

The ROCKY-548TX uses the AWARD PCI/ISA BIOS for system configuration. The AWARD BIOS setup program is designed to provide maximum flexibility in configuring the system by offering various options which may be selected for end-user requirements. This chapter is written to assist you in the proper usage of these features.

4.1 Getting Start

When power on the system, the BIOS will enter the Power-On-Self-Test routines. These routines will be executed for system test and initialization and system configuration verification. After the POST routines are completed, the following message appears :

" Hit DEL if you want to run SETUP"

To access AWARD PCI/ISA BIOS Setup program, press key. The following screen will be displayed at this time.

When choose **Load BIOS Defaults** will load the minimized settings for Troubleshooting. The performance should be very poor when use this setting.

When choose **Load Setup Defaults** will load optimized defaults for regular use. Choosing this setting, will modify all applicable settings.

4.2 Standard CMOS Setup

The Standard CMOS Setup is used for basic hardware system configuration. The main function is for Date/Time setting and Floppy/Hard Disk Drive setting. Please refer the following screen for this setup.

4.3 BIOS Features Setup

This BIOS Features Setup is designed for customer's tuning best performance of the ROCKY-548TX board. As for normal operation customers don't have to change any default setting. The default setting is pre-set for most reliable operation.

BootUp Sequence :

You could set the sequence of A:,C:,and CDROM.

Video BIOS Shadow C000,32K:

Enable - Will increase the video speed.

Shadow C8000-CFFFF,D0000-D7FFF, & D8000-DFFFF :

When the installed add-on card's ROM address is as above address,you could enable the shadow to get higher operation performance. When you enable the shadow function,it will also reduce the memory available by between

640KB and 1024KB.

4.4 Chipset Features Setup

This setup functions are almost working for ChipSet(Intel 430TX). These options are used to change the ChipSet's registers. Please carefully change any default setting ,otherwise the system could be running un-stable.

Auto Configuration : Enable or Disable

When use the 60nS general type DRAM,please enable the setting to get the optimal timings.

SDRAM Speculative Read : Enable or Disable

When enable this option, the PCU will send predict commands to the SDRAM, if a miss happens, the CPU will cancel this command. Because some OS under certain situations have problem for this feature, it is normally disable.

Memory Hole at 15M-16M : Enable or Disable

This setting reserve 15MB to 16MB memory address space for ISA expansion cards that specifically require this setting. Memory from 15MB and up will be unavailable to the system because expansion cards can only access memory up to 16MB.

CPU Warring Temperature : Disable,50 ..

There have a LM75 temperature sensor under the bottom of CPU,when set the CPU Warring Tempture to a certain limit which will help customer secure the system not burn out because of fan failed or other accident.

Hardware Monitoring : Customer could see the working status of this board for **Current CPU Temperature, Current System Temperature, Current CPUFAN1 Speed, Current CPUFAN2 Speed, Vcore voltage, Vio voltage, +5V, -5V, +12V, and -12V status.**

4.5 Integrated Peripherals

This setup is almost working for Multi-I/O Chip(W83977F). These options are used to change the ChipSet's registers. Please carefully change any default setting to meet your application need perfectly. The only special concern is Onboard Serial Port2. If you are using the IrDA port,you have to set this port accordingly.

4.6 Power Management Setup

Power Management Setup help user handles the ROCKY-548TX board's "green" function. The features could shut down the video display and hard disk to save energy for example. The power management setup screen is as following,

Power Management : Disable, Max Saving, Min Saving, or User Defined

Max Saving puts the system into power saving mode after a brief inactivity period. Min Saving is almost the same as Max Saving except that the inactivity period is longer. User Defined allows you to set power saving options according to your requirement.

Note : Advanced Power Management(APM) have to be installed to keep the system time updated when the computer enters suspend mode activated by the Power Management.

Under DOS environment, you need to add

DEVICE=C:\DOS\POWER.EXE in your CONFIG.SYS

Under Windows 3.x and Windows 95, you have to install

Windows with APM feature. A battery and power cord icon labeled "Power"

Will appear in the "Control Panel"

4.7 PNP/PCI Configuration

The PNP/PCI Configuration help user handles the ROCKY-548TX board's "PCI" function. All PCI bus slots on the system use INTA#, thus all installed PCI slots must be set to this value..

PNP OS Installed : Yes or No

When PNP OS is installed, interrupts may be reassigned by the OS when the setting is Yes. When a non-PNP OS is installed or to prevent reassigning of interrupt settings, select setting to No.

E² Key™ Function

The ROCKY-548TX provides an outstanding E²KEY™ function for system integrator. Based on the E²KEY™ you could free to store the ID Code, Pass Word, or Critical Data in the 1Kbit EEPROM. Because the EEPROM is nonvolatile memory, you don't have to worry the losing of the very important data.

Basically the E²KEY™ is based on a 1Kbit EEPROM which is configured to 64 words(from 0 to 63). You could access(read or write) each word at any time.

When you start to use the E²KEY™ you should have the utility in the package. The software utility will include four files as follows,

README.DOC
E2KEY.OBJ
EKEYDEMO.C
EKEYDEMO.EXE.

The E2KEY.OBJ provides two library function for user to integrate their application with E²KEY™ function. These library (**read_e2key** and **write_e2key**) are written and compiled in C format. Please check the following statement, then you will know how to implement it easily.

unsigned int read_e2key(unsigned int address)

/* This function will return the E²KEY™'s data at address. The address range is from 0 to 63. Return data is one word,16 bits */

void write_e2key(unsigned int address,unsigned data)

/* This function will write the given data to E²KEY™ at address. The address range is from 0 to 63. The data value is from 0 to 0xffff. */

To easy start to use the function, please refer the include EKEYDEMO.C code at first.

Please note the E²KEY™ function is based on the working of parallel port. So you should enable the ROCKY-548TX's parallel port, otherwise will be not working.

Appendix A. Watch-Dog Timer

The Watch-Dog Timer is provided to ensure that standalone systems can always recover from catastrophic conditions that caused the CPU to crash. This condition may have occurred by external EMI or a software bug. When the CPU stops working correctly, hardware on the board will either perform a hardware reset (cold boot) or a non-maskable interrupt (NMI) to bring the system back to a known state.

The Watch-Dog Timer is controlled by two I/O ports.

443 (hex)	Read	Enable the refresh the Watch-Dog Timer.
043 (hex)	Read	Disable the Watch-Dog Timer.

To enable the Watch-Dog Timer, a read from I/O port 443H must be performed. This will enable and activate the countdown timer which will eventually time out and either reset the CPU or cause an NMI depending on the setting of JP13. To ensure that this reset condition does not occur, the Watch-Dog Timer must be periodically refreshed by reading the same I/O port 433H. This must be done within the time out period that is selected by jumper group JP15.

A tolerance of at least 30% must be maintained to avoid unknown routines within the operating system (DOS), such as disk I/O that can be very time consuming. Therefore if the time out period has been set to 10 seconds, the I/O port 443H must be read within 7 seconds.

Note: when exiting a program it is necessary to disable the Watch-Dog Timer, otherwise the system will reset.
